I. INTRODUCTION

Environmental Liability Management of New York, LLC (“ELM”) was retained by Forest City Residential Group to complete a Phase I Environmental Site Assessment the property referred to as Echo Bay Redevelopment, Parcel Phase I(a). The legal definition of the property is Section 1, Block 84, Lots 0005, 0022 and 0110, New Rochelle, New York (the “subject property” or “property”). The property is approximately 10.62 acres in size and is bound by Main Street to the north, commercial uses to the east and west, and Echo Bay to the south.

The Phase I assessment was completed in accordance with the American Society for Testing and Materials (“ASTM”) Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process Standard E1527-05. This Phase I ESA included a site inspection of the subject property and the adjacent and surrounding properties; a review of environmental agencies’ databases; FOIL inquiries with City, State, and Federal agencies; a review of historical topographic photographs, historical aerial photographs, Sanborn Fire Insurance Maps and city directories; the performance of an environmental lien search; a review of previous studies; and interviews with property owners and others familiar with operations at the site. The objective of the environmental assessment was to identify, to the extent feasible pursuant to the ASTM Standard 1527-05, Recognized Environmental Conditions\(^1\) (“RECs”) in connection with the property.

\(^1\) A recognized environmental condition is defined as the presence or likely presence of any hazardous substances or petroleum products on the property under conditions that indicate an existing release, a past release, or a material threat of a release of any hazardous substances or petroleum products into structures on the property or into the ground, ground water, or surface water of the property.
II. SUMMARY OF SITE CONDITIONS AND OPERATIONS

A. Site Inspection Data

<table>
<thead>
<tr>
<th>Date of Inspection:</th>
<th>March 8, 2007</th>
</tr>
</thead>
<tbody>
<tr>
<td>ELM Personnel:</td>
<td>Mimi S. Raygorodetsky</td>
</tr>
</tbody>
</table>
| Other Parties:      | • Lots 0022 and 0110: Suzanne D’Amato of City of New Rochelle  
|                     | • Lot 0005: Joseph Cotroneo and Richard Fevang of City of New Rochelle Department of Public Works |

Note: This inspection did not include any testing or sampling of materials (for example, soil, water, air, or building materials). The site visit included a site inspection of the subject property and a visual assessment of surrounding properties. The site inspection was conducted in a systematic manner focusing on the exterior and interior spaces. The inspection included observations for chemical storage/usage, bulk storage tanks, solid waste, sewage, stained or stressed soil and vegetation, liquid discharges, pools of liquids, pits/ponds/lagoons, floor drains/sumps, electrical equipment and elevators.

Below is a summary of site inspections by individual lots that comprise the subject property. Please see Attachment B for photographs from the March 8, 2007 site inspection.

- **Section 1, Block 84, Lot 0005 (6.47 Acres):** Lot 0005 is currently occupied by the City of New Rochelle Department of Public Works. The lot currently contains several interconnected one-story brick and concrete structures in the northern portion of the site and one free-standing, large, brick structure and one free-standing, large, corrugated metal structure, both in the southern portion of the site. Lot 0005 also contains paved surfaces. The structures were either used for offices, storage or for the repair of city-owned vehicles. At the time of the inspection, vehicle repair operations were reportedly limited to within the large, corrugated metal structure located in the southern portion of the site. On-site structures were noted to utilize fluorescent lighting and to contain suspect asbestos-containing building materials. The paved surfaces were used for auto and machine parking, for materials/supplies storage or as a transfer station for recyclables collected for the City of New Rochelle. Several piles of dirt were also
observed on the paved portions of the lot. The dirt did not appear to contain a
significant amount of fill material, it was not stained and it did not exhibit an odor.

The table below itemizes chemical storage tanks that were observed or reported
by City of New Rochelle personnel during site inspection.

<table>
<thead>
<tr>
<th>Tank(s)</th>
<th>Notes</th>
<th>Location</th>
</tr>
</thead>
<tbody>
<tr>
<td>• 2 x 500-gal ASTs</td>
<td>Contents not specified. However, because of location in the boiler room, it is likely that these tanks are or were used to storage fuel oil. Tanks were in containment. It is unknown if these tanks were active.</td>
<td>In boiler room located in the cellar of a one-story structure in the northern-most portion of the lot. A vent pipe and fill cap were noted outside of the structure.</td>
</tr>
<tr>
<td>• 1 x 275 gal AST</td>
<td>Contents unknown. Tanks were in containment. It is unknown if these tanks were active.</td>
<td>In the lunchroom of a one-story structure located on the northern-most portion of the lot.</td>
</tr>

<td>• 1 x 475-gal hydraulic fluid AST</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• 1 x 650-gal waste oil AST</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• Several hydraulic oil ASTs associated with former hydraulic lifts</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

In addition to ASTs and evidence of USTs, many chemicals used in auto repair
were observed to be present on Lot 0005. These chemicals were stored in 55-
gallon drums or smaller containers and were generally located within the
corrugated metal garage building. Welding gasses were also noted to be present
in a portion of the corrugated metal garage building.

The following table described the USTs that were removed from Lot 0005 over
the last several years, according to Mr. Richard Fevang, Fleet Manager for the
City of New Rochelle Department of Public Works. This table has been
supplemented with information provided by Mr. Kaz Orszulik, Senior Engineer at the Department of Public Works and by information provided in previous studies and other relevant documentation. Mr. Orszulik is responsible for tank installations/removals and subsurface investigation and remediation that occur on Lot 005.

<tr>
<td>• 1 x 5,000-gallon diesel and 2 x 2,000-gallon gasoline USTs</td>
<td>These tanks were reportedly removed from the Lot in 1998 and 2001.</td>
<td>A concrete pad was observed between the old large brick structure and the newer corrugated metal garage in the southern portion of the site.</td>
</tr>
<tr>
<td>• 4 x 1,000-gallon fuel oil USTs</td>
<td>Mr. Fevang indicated these tanks were removed in 1994.</td>
<td>A concrete pad was observed directly east of the newer corrugated metal garage in the southern portion of the site.</td>
</tr>
<tr>
<td>• 1 x 2,500 gallon waste oil UST.</td>
<td>This tank was reportedly removed in 2003.</td>
<td>An asphalt pad was observed directly south of the newer corrugated metal garage in the southern portion of the site.</td>
</tr>
<tr>
<td>• 55-gallon Kerosene AST</td>
<td>Mr. Fevang indicated these tanks were removed from the northcentral portion of the site in the late 1990s.</td>
<td>Inside of the corrugated metal garage.</td>
</tr>
</tbody>
</table>

Mr. Fervang and Mr. Orszulik reported that contaminated soil was discovered in the vicinity of the diesel and gasoline tanks that were removed from between the old large brick structure and the newer corrugated metal garage in the southern portion of the site. Contaminated soil was reportedly removed from this area and six groundwater monitoring wells were installed and sampled. Mr. Orszulik noted that, in 2004, three or four more groundwater monitoring wells were installed in this area as part of a plan to operate an air sparging system in this area to remediate contaminated groundwater. Mr. Orszulik stated that the New York State Department of Environmental Conservation (NYS DEC) agreed to delay the construction and operation of the air sparging system until additional soil remediation (see next paragraph) has occurred. At least four groundwater monitoring well manhole covers were observed in this area during the site inspection.

Mr. Fervang also reported that contaminated soil was discovered when underground piping was installed to link the current gasoline and diesel ASTs to the pump island located directly east of the corrugated metal garage. Mr. Fervang reported that some contaminated soil was removed from this area. Mr. Orszulik noted that, during this soil removal, a buried former sewer pump station
foundation was identified to be present. The former foundation reportedly acts as a sink for the collection of contaminated water and oil in the area. Mr. Orszulik noted that, in conjunction with NYS DEC, the foundation would be pumped free of contaminated water and the impacted soil would also be removed. The removal of additional water/oil from this area is reportedly currently underway under the direction of NYS DEC Spills Group.

A self-contained parts cleaner was noted within the corrugated metal garage building. Mr. Fervang explained that the cleaner recycled mineral spirits by filtering out impurities from the spirits and burning them at the end of each work day.

Spent automobile batteries were observed to be stored on a shelf in the corrugated metal garage. According to Mr. Fervang, these batteries are removed from the premises on an as-needed basis and are disposed of off-site.

Mr. Fervang noted that an oil/water separator was installed between the old large brick structure and the newer corrugated metal garage in the southern portion of the site. Water used in vehicle maintenance in the corrugated metal garage is reportedly collected in metal-grated trenches and directed through this oil water separator before it is discharged to the municipal sewer system. Oil is reportedly removed from the oil/water separator on an as-needed basis.

The corrugated metal garage building is also reportedly outfitted with an in-ground vehicle exhaust system. Mr. Fervang explained that when a vehicle is running within the garage, a tube is connected to the vehicle exhaust and is discharged to a port in the floor that leads to a roof top exhaust.

- **Section 1, Block 84, Lot 0022 (2.92 acres):** Lot 0022 currently contains a former Armory. The lot contains four structures:
- a large, three-story, brick-structure with a basement in the northern portion of the lot;

- a corrugated metal structure in the southern portion of the lot;

- a small, one-story garage structure in the southern portion of the lot; and

- a small storage shed located immediately south of and adjacent to the large, three-story, brick structure with a basement in the northern portion of the site.

In addition, the Lot includes paved and landscaped surfaces. The one-story garage and the storage shed were inaccessible at the time of inspection, but reportedly contained stored building materials. The large three-story brick structure is vacant most of the time, with the exception of around Halloween, when it is used by the City of New Rochelle as a Haunted House, and when it is rented for use as a movie set. The corrugated metal structure is currently leased by Habitat for Humanity for building materials storage. Habitat for Humanity also stores building materials in metal containers and in piles on the paved and landscaped portions of the lot. One 20-cubic yard waste container was noted to be present on the paved and landscaped areas. It was filled with miscellaneous building materials. A stack of paint cans and containers in <5-gallon capacity were noted to be stored in a landscaped area in the southern portion of the site.

Two 275-gallon ASTs, two old boilers, wall-mounted electrical units and a water tank were noted to be present in a boiler room located in the basement of the large three-story brick building. A vent pipe and fill cap, which may be associated with the ASTs in the boiler room, were observed outside of the southern side of this building. Both on-site structures were noted to utilize fluorescent lighting and to contain suspect asbestos-containing building materials. One half-full 55-gallon drum was observed to be present in the basement; the contents of this drum were unknown. A former shooting range associated with the Armory use was
observed in the basement of the three-story building. The floor of the range was concrete and no bullets or spent shot were observed in the room.

- **Section 1, Block 84, Lot 0110 (.90 acres):** Lot 0110 currently contains two one-story vacant structures (one small, one-story, brick and concrete structure in the northern portion of the site and one larger, one-story corrugated metal structure in the western portion of the site), a bulkhead fronting Echo bay and paved and landscaped surfaces. Lot 0110 was reportedly historically utilized as a marina.

One 275-gallon AST was observed inside of the large one-story corrugated metal structure. The contents of the tank were unknown. A metal container box, an abandoned boat and car, miscellaneous trash, and concrete filled drums were observed on the landscaped and paved portions of the lot. One 55-gallon drum was observed within the metal container box; the contents of this drum were unknown. Several piles of dirt were also observed on the landscaped and paved portions of the lot. The dirt did not appear to contain a significant amount of fill material, it was not stained and it did not exhibit an odor. A boom was noted floating in the icy water in Echo Bay immediately adjacent to the lot.

**III. HISTORICAL SEARCH**

According to ASTM Standard E1527-05, all obvious uses of the property shall be identified from the present, back to the property's obvious first developed use, including agricultural use, or back to 1940, whichever is earlier. A search was performed for available aerial photographs (Attachment C), historical topographic maps (Attachment D), Sanborn Maps (Attachment E), and city directories (Attachment F).

**A. Aerial Photographs**

ELM reviewed available aerial photographs of the subject property and surrounding areas for the years 1954, 1966, 1974, 1989, and 1994. Copies of aerial photographs are included in Attachment C.

<table>

Historical aerial photographs indicated that the subject property was developed prior to 1954 with commercial uses. The presence of many boats was noted on Lot 0110 and in Echo Bay adjacent to the lot in the 1966 aerial photograph. This may indicate the presence of a former operating marina. Mismanagement and/or on-site disposal chemicals used in association with fueling or maintaining these boats could have lead to soil or groundwater contamination on the lot. Dense auto parking was observed on Lot 0110 in aerial photos from 1954 and/or 1966. Mismanagement and/or on-site disposal of chemicals associated with auto related uses could have lead to soil or groundwater contamination on these lots. A series of aboveground oil tanks were noted adjacent to Lot 0067 on Lot 0069 in aerial photos from 1954 through 1989; these lots are located west-adjacent to Lot 0110. Releases from these tanks may have impacted soil and/or groundwater on Lot 0110. ELM’s review of aerial photographs did not identify any other past uses indicating recognized environmental conditions at the subject property or in the surrounding area.
B. Historical Topographic Maps

ELM reviewed available historical USGS Topographic Quadrangles obtained from EDR for information regarding past uses of the subject property. Quadrangle maps were available for the years 1897, 1947, 1956, 1966, 1967-1979 (photo-revised), and 1995.

<table>
<thead>

<td>No significant changes were noted for the surrounding area.</td>
</tr>
</tbody>
</table>

In summary, the subject property and surrounding area appear to have been developed circa 1897. The shoreline along Echo Bay appeared to have been filled along the project site and in the surrounding area between 1897 and 1947; it is unknown what materials were used to fill in the shoreline. An armory was first noted to be present on the subject property in the 1947 Map. A sewage disposal plant was first noted to be present southwest of the subject property in the 1956 Map. Copies of the topographic maps are provided in Attachment D.

C. Historical Sanborn Fire Insurance Maps

ELM reviewed Sanborn Fire Insurance Maps (Sanborn Maps) for the subject property and/or the surrounding area for the years 1892 (surrounding area only), 1986 (surrounding area only), 1903 (surrounding area only), 1911, 1931, 1951 and 1990. Sanborn Maps were originally created for assessing fire insurance liability in urbanized
areas in the United States. The maps constitute a database of prior site uses of real property for many cities and towns in the United States. Copies of the maps are provided in Attachment E. Review of the Sanborn Maps identified the following:

<table>
<thead>
<tr>
<th>Year</th>
<th>Summary</th>
</tr>
</thead>
</table>
| 1892 and 1896 | **Site:** No maps were readily available.  
**Surrounding Area:** The area surrounding the subject property to the west and northwest was shown to contain single-family residential structures. No other maps were readily available. No uses of environmental concern were identified in the area surrounding the subject property. |
| 1903       | **Site:** No maps were readily available.  
**Surrounding Area:** The area surrounding the subject property to the west and northwest was shown to contain L.O. Huntington, Jr. Boat Builder, the Westchester Lighting Co. and single-family residential structures. No other maps were readily available. No uses of environmental concern were identified in the area surrounding the subject property. |
| 1911       | **Site:**  
Lot 0005 was shown to contain Stonberg’s Boat Yard.  
Lot 0022 was shown to contain two residential dwellings, a poultry house and a tool house.  
Lot 0110 was shown to contain a boat house and a hen house.  
**Surrounding Area:** The area surrounding the subject property to the west, north, northwest, east and south was shown to contain single-family residential structures. The Westchester Lighting Co. was located west of Lot 0110. The New York & New Rochelle Auto Co was noted to the northwest of the subject property, near the southwest corner of the intersection of Main Street and Echo Avenue. A lunch wagon factory was noted east of the subject property near the southwestern corner of the intersection of Le Fevres Lane and East Main Street. No other maps were readily available. |
| 1931       | **Site:**  
Lot 0005 was shown to contain the Department of Public Works – Bureau of Streets. Structures associated with this use included garages for street cleaning machinery, automobiles and trucks; a compost building; and a sewage disposal plant.  
Lot 0022 was shown to contain a residence and several small auto houses (typically garages associated with residential structures for one or more cars).  
Lot 0110 was shown to be vacant.  
**Surrounding Area:** The area surrounding the subject property to the west, north, northwest, east, northeast and south was shown to contain residential and commercial uses. P.J. Tierney Sons, Inc. (a manufacturer of dining cars), Wykagyl Supply Corporation (a supplier of coal and building materials) and two auto repair |
facilities were noted to the east of the subject property. A filling station with two gasoline tanks and an auto repair facility were indicated northeast of the subject property, near the intersection of Stonella Place and East Main Street. Several industrial uses of note were shown to the northwest and west of the subject property, on the portion of land located at the southeast corner of the intersection of Echo Avenue and Main Street, including two oil storage terminals (Pure Oil Company and Standard Oil Co of New York), the Westchester Lighting Co. – Electric Station, two gasoline filling stations and several auto repair and auto sales facilities.

| 1951 | Site:  
| Lot 0005 was shown to contain the Department of Public Works – Bureau of Streets. Structures associated with this use included garages for automobiles and trucks; an auto repair garage, a compost building, a storage facility and a municipal garage.  
| Lot 0022 was shown to contain two structures labeled “Drill Shed” and “Class R’m’s”.  
| Lot 0110 was shown to be vacant.  
| Surrounded Area: The area surrounding the subject property to the west, north, northwest, east, northeast and south was shown to contain residential and commercial uses. Several industrial uses of note were shown to the northwest and west of the subject property, on the portion of land located at the southeast corner of the intersection of Echo Avenue and Main Street, including a single oil storage terminal (the two terminals formerly operated by Pure Oil Company and Standard Oil Co of New York appeared to have been combined into a single terminal operated by Sentinel Oil Co. Inc.), the Westchester Lighting Co. – Electrical Station and several auto repair and auto sales facilities. A filling station showing gasoline tanks was noted on the southwest corner of the intersection of Echo Avenue and Main Street. Three filling stations, a used auto sales facility and auto service stations were noted northwest of the intersection of Main Street and Echo Avenue. A filling station with two gasoline tanks and a furniture warehouse was noted north of the subject property across Main Street. An auto repair facility, a filling station and an upholster were indicated northeast of the subject property, near the intersection of Stonella Place and East Main Street. A chemical laboratory, three auto sales and service facilities were noted east of the subject property, southwest of the intersection of East Main Street and Le Fevres Lane. |

| 1990 | Site:  
| Lot 0005 was shown to contain the Department of Public Works – Bureau of Streets – Vehicle Storage and Parking. Structures associated with this use included garages for automobiles and trucks; an auto repair garage, a police garage, a storage facility and a municipal garage.  
| Lot 0022 was shown to contain two structures labeled “Naval and Marine Center - Drill Shed” and “Class R’m’s”.  
| Lot 0110 was shown to contain a boat yard with a motor house.  
| Surrounded Area: The area surrounding the subject property to the west, north, |
northwest, east, northeast, south and southeast was shown to contain residential and commercial uses. Several industrial uses of note were shown to the northwest of the subject property, on the portion of land located at the southeast corner of the intersection of Echo Avenue and Main Street, including a single oil storage terminal (operated by Shore Line Oil Co. Inc.), Power Tronic Systems Electronics, Consolidated Edison Co. of New York – Electric Station, a machine shop, an auto painting shop, one gasoline service station an auto sales facility and several auto repair facilities. Several auto sales and service stations were noted north of the subject property across Main Street. An electronics laboratory, a chemical laboratory, a building labeled “assembling transmitters”, school bus parking, auto parking and auto repair facilities were noted east of the subject property, southwest of the intersection of East Main Street and Le Fevres Lane. A municipal Water Pollution Control Facility was located to the southeast of the subject property.

Based upon the review of the Sanborn Maps, the subject property has over a 100-year history of industrial uses, including the following:

- **Lot 0005**: A boat yard (circa 1911), the Department of Public Works – Bureau of Streets (circa 1931 through circa 1990);
- **Lot 0022**: Residential dwellings and associated out buildings (circa 1911 through circa 1931); a drill shed and classrooms (circa 1951 through 1990 [a notation on the 1990 map indicated these structures were associated with a Naval and Marine Center]); and
- **Lot 0110**: A boat house and hen house (circa 1911), vacant land (circa 1931 through 1951) and a boat yard and motor house (circa 1990);

The surrounding properties were shown to be primary residential in nature circa 1892 through 1903. Commercial and industrial uses were shown to be interspersed with residential uses in maps from 1911 through 1990. Commercial and industrial uses in the surrounding area included: a lunch wagon factory (circa 1911), a manufacturer of dining cars (circa 1931), a supplier of coal and building materials (circa 1931), oil storage terminal(s) (circa 1931 through 1990), The Westchester Lighting Co. – Electric Station (circa 1903 through circa 1951) and Consolidated Edison Co. of New York – Electric Station (circa 1990); a chemical laboratory (circa 1951 through circa 1990), a furniture warehouse (circa 1951), an upholsterer (circa 1951), Power Tronic Systems Electronics
(circa 1990), an electronics laboratory (circa 1990) and auto repair facilities, auto parking, auto sales, auto painting and filling stations (various years).

D. City Directory Search

Environmental Data Resources, Inc. was retained to perform a search of business directories, including city reverse telephone directories, for the subject property. Environmental Data Resources, Inc. provided EDR City Directory Abstracts for the following address: 206 Main Street and 280 Main Street. Both the target address and adjacent property addresses were searched in each abstract. Business directories were reviewed, if available, at approximately ten-year intervals for the years spanning 1975 through 2006 (not necessarily inclusive). For purposes of brevity, only listings for the subject property and surrounding properties assumed to be commercial or industrial (non-residential) and to be potentially significant are summarized below. Lot 110 does not appear to have a numbered address on Huntington Place. As such, it was not possible to search for previous listings in city directories. For complete results, including assumed residential listings, please see Attachment F.

E. **Lien Search**

Environmental Data Resources, Inc. (EDR) was retained to perform a search of available land title records for environmental liens. A lien search report was received for the three lots that comprise the subject property. According to the EDR report s, no environmental liens or other activity and use limitations were found for the three lots that were searched. Results of the Lien Search are provided in Attachment G.

F. **Environmental Database Search**

An Environmental Report was acquired from Toxics Targeting, Inc. a commercial database service, for the subject property. Toxics Targeting searches federal, state and local databases that maintain records regarding potential and actual environmental threats within search distance specified in the ASTM Standard E1527-05. The minimum search distance for specific government records varies from 0.0 miles (target property only) to 1.0 mile, according to the requirements of ASTM Standard E1527-05.

ELM reviewed each environmental database on a record by record basis from federal, state and local sources provided in the February 4, 2007 report; a copy of the Toxics Targeting, Inc. report is provided in Attachment A.

It should be noted that several hundred orphan sites were identified for Westchester County (i.e., sites where the address information is insufficient to locate the property on the EDR location maps). For a complete list of orphan sites, please see Attachment A.

1. **Federal Databases**

The federal records reviewed included the National Priority List (NPL); Comprehensive Environmental Response, Compensation, and Liability Information System (CERCLIS); and Emergency Response Notification System (ERNS). The federal listing of facilities which are subject to corrective action under the Resource Conservation and Recovery Act (CORRACTS) is discussed with the State databases of RCRA listings.
a. National Priority List

The NPL is the USEPA’s database of some of the most serious uncontrolled or abandoned hazardous waste sites identified for probable remedial action under the Superfund Program. These sites may constitute an immediate threat to human health and the environment. Due to the amount of public attention focused on NPL sites, they pose a significant risk of stigmatizing surrounding properties and potentially impacting property values.

No NPL sites were identified within a one-mile radius of the subject property. No delisted NPL sites were located within a half-mile radius of the subject property.

b. Comprehensive Environmental Response, Compensation, and Liability Information System

CERCLIS is a compilation of known or suspected, uncontrolled or abandoned hazardous waste sites which the USEPA has investigated, or plans to investigate, for a release, or threatened release, of hazardous substances pursuant to the Superfund Act of 1980 (CERCLA). Some of these sites may constitute a potential threat to human health and the environment. While it has been determined by the USEPA that some CERCLIS sites require no action, others could pose a real or perceived environmental threat to neighboring properties, thus affecting property values.

One CERCLIS site was identified within a one-mile radius of the subject property.

The Consolidated Edison (Con Edison) Echo Avenue Site, located on Lot 0073 approximately 150 feet southwest of Lot 0110, was listed as a CERCLIS Superfund Site. The listing indicates that no further remedial action is currently planned for the site through the CERCLIS program. No further relevant site information was provided in the listing.
c. Emergency Response Notification System (ERNS)

This federal database, compiled by the Emergency Response Notification System, records and stores information on reported releases of petroleum and other potentially hazardous substances.

A search for ERNS sites was conducted on the subject property and on the property adjacent to the subject property that comprises parcels Phase 1(b), Phase 2(a) and Phase 2(b) of the Echo Bay Redevelopment Site. A total of 17 ERNS sites (one site was listed in duplicate) were listed as being located on the subject property or on Phases 1(b), 2(a) and 2(b). Because these sites are not physically mapped and because the locations of the listings are mostly described in general terms (for example: “NEAR CITY MARINA EVANS PLACE OFF OF MAIN ST.”), it is difficult to determine which of these listings are located on the subject property or on adjacent parcels.

A summary of the ERNS Listings is provided in the table below.

<table>
<thead>
<tr>
<th>Spill Number</th>
<th>Spill Date</th>
<th>Location</th>
<th>ERNS Listing Summary</th>
</tr>
</thead>
<tbody>
<tr>
<td>350344</td>
<td>12/06/1993</td>
<td>Near City Marina Evans Place off of Main St.</td>
<td>The listing documented a release of approximately 100 gallons of No. 6 fuel oil into Echo Bay. The listing noted a .25-mile sheen present on the surface water.</td>
</tr>
<tr>
<td>448205</td>
<td>07/09/1995</td>
<td>Echo Ave. between Main Street and Sarragut Circle</td>
<td>The listing indicated that a caller reported that soil and waste (Echo Bay) had been affected by PCBs.</td>
</tr>
<tr>
<td>450184</td>
<td>08/16/1995</td>
<td>Echo Bay Substation, Echo Street &amp; Main Street (possibly Lot 0073 on parcel Phase 2(b))</td>
<td>The listing reported that asbestos was released from roofing material from a public utility (Con Edison). The listing reported that a cleanup was scheduled.</td>
</tr>
<tr>
<td>479553</td>
<td>02/14/1996</td>
<td>206 Boston Post Road</td>
<td>The listing reported that 100 gallons of No. 2 fuel oil entered a storm drain leading to Echo Bay.</td>
</tr>
<tr>
<td>570566</td>
<td>03/04/1998</td>
<td>220 Main Street (possibly Lot 0005 on the subject property)</td>
<td>The listing reported oil seeping from the Back of the Long Island Sound. The listing reported that booms were deployed from the Fire Department, presumably to contain and cleanup the spill.</td>
</tr>
<tr>
<td>352352</td>
<td>12/21/1993</td>
<td>Huntington Place</td>
<td>The listing reported that a sheen was discovered in Echo Bay and that the source of the sheen was a storm culvert.</td>
</tr>
</tbody>
</table>
In addition, two ERNS sites were identified as being potentially on the subject property or on parcels Phase 1(b), 2(a) or 2(b). These listings are summarized in the table below:

<table>
<thead>
<tr>
<th>Potential On-Site ERNS Listing Data</th>
<th>ERNS Listing Summary</th>
</tr>
</thead>
</table>
| Spill Number: 370118  
Spill Date: 05/01/1994  
Location: Long Island Sound, Echo Bay | The listing documented that a sheen was observed in Echo Bay. |
| Spill Number: 370123  
Spill Date: 05/01/1994  
Location: Long Island Sound, Echo Bay | The listing indicated that a sheen was observed in Echo Bay. |
The aforementioned ERNS listings for the subject property and surrounding property suggest that there have been several petroleum, asbestos and PCB-releases that may have affected on-site soil and Echo Bay over the last 14 years.

2. **State Databases**

The state records reviewed included the listings of hazardous material spills (SPILLS); Resource Conservation and Recovery Act Notifiers (RCRA); Chemical Bulk Storage (CBS); Solid Waste Facilities (SWF); Petroleum Bulk Storage (PBS); State Inactive Hazardous Waste Disposal Sites (SHWS); Major Oil Storage Facilities (MOSF); Brownfields Sites and Institutional Control/Engineering Control sites.

a. **New York SPILLS Database**

The New York SPILLS database includes a list of releases reported to the NYSDEC, including those attributed to tank test failures and tank failures. The tank test failures list only covers tanks that are below ground, while the tank failures list includes those that are either below or above ground. This database also lists spills that occur during the transportation of chemicals.

Twenty-one active status spill listings were reported within a half-mile radius of the subject property, including two listings located on-site and eight listings located within a quarter-mile radius of the subject property. Two hundred and ninety closed status spill listings were reported within a half-mile radius of the subject property, including listings for the subject property and for immediately adjacent properties. Closed status spill listings have been remediated to the satisfaction of NYS DEC and, as such, are unlikely to pose environmental concern to the subject property.

A summary of the active listings located within a quarter-mile radius of the subject property is below:
• The New Rochelle Department of Public Works, located on Lot 0005 on the subject property, was listed because a tank test failure occurred on a 2,000-gallon gasoline underground storage tank located in a garage in 1998.

• The New Rochelle Department of Public Works was listed a second time in the Spills database. The active listing reported that someone performing ‘site work’ identified petroleum-contaminated soil in 2001. The listing indicated that a groundwater investigation was performed in 2002 and a soil vapor extraction/air sparging pilot test occurred in 2004.

• A building located at 199 Main Street, approximately 30 feet northeast of the subject property, was listed because a tank overflow occurred in the basement of the building in 2005. This property is located cross-gradient with respect to anticipated groundwater flow direction from the subject property. As such, it is unlikely that this release may have impacted the subject property.

• The Mendez home, located at 25 Lispenard Avenue, approximately 303 feet northeast of the subject property, was listed because a tank test failure occurred on a 550-gallon fuel oil tank in 2006. This property is located cross-gradient with respect to anticipated groundwater flow direction from the subject property. As such, it is unlikely that this release may have impacted the subject property.

• A commercial building, located at 125 Main Street, approximately 641 feet northeast of the subject property, was listed because petroleum-contaminated soil was observed to be associated with a 275 gallon storage tank in 2006. This property is located cross-gradient with respect to anticipated groundwater flow direction from the subject property. As such, it is unlikely that this release may have impacted the subject property.

• Avber Newrock Loc, also listed at 125 Main Street, was listed because contamination was encountered while removing hydraulic lifts from the site in 2006. The listing reported that spill cleanup was ongoing. This property is located
cross-gradient with respect to anticipated groundwater flow direction from the subject property. As such, it is unlikely that this release may have impacted the subject property.

- The Ring home, located at 140 Huguenot Street, approximately 837 feet west of the subject property, was listed because a tank test failure occurred on a 10,000 gallon fuel oil tank in 2005. This property is located cross-gradient with respect to anticipated groundwater flow direction from the subject property. As such, it is unlikely that this release may have impacted the subject property.

- The Watt residence, located at 65 Jackson Street, approximately 967 feet northwest of the subject property, was listed because there may have been a leaking fuel oil tank located on-site in 2006. A fuel oil truck reportedly dispatched more fuel than the tank gauge read the tank contained. The listing mentions that the gauge on the dispatch truck may not have functioned properly and no oil may have been released at all. This property is located cross-gradient with respect to anticipated groundwater flow direction from the subject property. As such, it is unlikely that any release related to this listing has impacted the subject property.

- Municipal Marina, located at 22 Pelham Road, approximately 1,138 feet south of the subject property, was listed because contaminated soil was discovered during tank removal in 2004. The listing reported that spill cleanup was ongoing. This property is located down-gradient with respect to anticipated groundwater flow direction from the subject property. As such, it is unlikely that this release may have impacted the subject property.

- A private home located at 24 Sherman Street, approximately 1,204 feet north of the subject property was listed as having a leaking 275-gallon fuel oil tank in its basement in 2006. Because of the distance of this listing from the subject property and because the spill reportedly occurred in a basement, it is unlikely that this release would have impacted the subject property.
b. Resource Conservation and Recovery Act (RCRA) Notifiers Listings

The NYSDEC’s Bureau of Hazardous Waste Facility Compliance regulates hazardous waste from the point of generation to the point of disposal. The identified sites tracked on this list are those which have filed notification forms in accordance with the Resource Conservation and Recovery Act requirements regarding their hazardous waste activity. These sites include treatment, storage and disposal facilities (TSDs); small-quantity and large-quantity generators; and transporters of hazardous waste regulated under RCRA. The discussion below includes any CORRACTS listings of facilities which are subject to corrective action under RCRA.

One RCRA CORRACTS site was listed within a one-mile radius of the subject property. Teledyne Hydra-Power, Inc, located at 10-12 Pine Court, approximately 4,037 feet southwest of the subject property, was listed as a Small Quantity Generator in the CORRACTS database. Information provided in the listing indicated that a Remedial Feasibility Analysis was completed in 1992 and that the site was given a Low Corrective Action Priority in 1994. No additional information was provided in the listing.

No TSD facilities were identified within a one-mile radius of the subject area.

Thirty-six RCRA Generators/Transporters were reported within a 1/4-mile radius of the subject site, including 5 listings located on the subject property and an additional 12 listings immediately adjacent to the subject property. Details of the on-site facilities are as follows:

- The Municipality of New Rochelle, listed at 224 Main Street on Lot 0005 on the subject property, was listed in the RCRA database for having generated 12,135 gallons of solid waste that exhibits the characteristic of ignitability in 1983. There were no violations associated with this listing.
- City of New Rochelle – City Yard, listed at 224 East Main Street on Lot 0005 on the subject property, was listed as a Conditionally-Exempt Small Quantity
Generator in the RCRA database for having generated 40 gallons of solid waste that exhibits the characteristic of corrosivity in 1997. There were no violations associated with this listing.

- NYS DEC Region 3, listed at 270 Main Street on Lot 0022 on the subject property, was listed in the RCRA database for having generated 200 pounds of mercury in 2000. There were no violations associated with this listing.

- Naval Motion Picture Service, listed at 270 Main Street on Lot 0022 on the subject property, was listed in the RCRA database as a Conditionally-Exempt Small Quantity Generator for having generated 55 gallons of lead in 1994. There were no violations associated with this listing.

- US Navy Motion Picture Service, listed at 270 Main Street on Lot 0022 on the subject property, was listed in the RCRA database as a Conditionally-Exempt Small Quantity Generator. No information related to the type or volume of wastes generated was provided in the listing. There were no violations associated with this listing.

The 12 generators referenced in listings immediately adjacent to the subject property were generally related to the automobile, petroleum, dry cleaning or energy industries. There were no violations associated with any of these listings.

c. Chemical Bulk Storage (CBS) Database

The New York CBS is a list of facilities that store regulated non-petroleum substances in aboveground tanks with capacities greater than 185 gallons and/or in underground tanks of any size.

One CBS facility was listed within a 1/4-mile radius of the subject property. The New Rochelle Wastewater Treatment Plant, listed at 1 LeFevre Lane, approximately 541 feet east of the subject property, was listed in the CBS database for having five sodium
hypochlorite aboveground storage tanks varying in capacity from 1,000 gallons to 2,100 gallons.

d. Solid Waste Facilities (SWF)

This database includes a listing of landfills, incinerators, transfer stations, recycling centers, and other sites which manage solid waste.

One Solid Waste Facilities was identified within a one-mile radius of the study site. New Rochelle Leaf T.S., listed at 515 North Avenue, approximately 669 feet east of the subject property, was listed as a Small Transfer Station for leaves.

e. Petroleum Bulk Storage (PBS) Database

The New York State PBS lists commercial facilities with registered petroleum tanks located either above or below ground in excess of 1,100 gallons and less than 400,000 gallons.

Thirty-six PBS facilities were identified within a ¼-mile radius of the subject property, including three listings for the subject property. Details for the three listings on the subject property follow:

- New Rochelle Municipal Yard, listed at 224 East Main Street on Lot 0005 on the subject property, was listed in the PBS database as having the following tanks on-site:

  o One 3,000-gallon and four 1,000-gallon in-service lube oil underground storage tanks (USTs);

  o One 2,000-gallon and one 5,000-gallon in-service fuel oil USTs;

  o One 550-gallon closed fuel oil UST with vaulted access;

  o One 5,000-gallon in-service diesel UST; and
- Two 2,000-gallon in-service unleaded gasoline USTs.

- New Rochelle Armory, listed at 270 East Main Street on Lot 0022 on the subject property, was listed in the PBS database for having one 8,000-gallon in-service fuel oil UST with vaulted access.

- Navy Motion Picture Service, listed at 270 Main Street on Lot 0022 on the subject property, was listed in the PBS database as having one 7,500-gallon in-service fuel oil UST with vaulted access.

Details of the additional 33 PBS facilities located within a ¼-mile of the study site are included in Appendix C.

f. State Inactive Hazardous Waste Disposal Site Registry

This database maintains information and aids decision-making regarding the investigation and clean-up of hazardous sites. The Registry’s information includes the clean-up status, type of clean-up, types and quantities of contaminants involved, and the assessment of health and environmental concerns.

One State Inactive Hazardous Waste Disposal Sites was reported within a one-mile radius of the subject property. Consolidated Edison – Echo Avenue Site, located on Lot 0073 on parcel Phase 1(b), was listed in the State Inactive Hazardous Waste Disposal Site Registry. The site description for the listing appears to have been written prior to 2002. The description notes that the Con Edison site was originally the Westchester Lighting Company and was subsequently acquired by Con Edison in the 1930s. Con Edison operated an electrical distribution substation at the site until 1981, when the substation was closed. Site investigations, at least one of which was completed under a Consent Order from NYS DEC, indicated the presence of PCBs in on- and off-site soils, building materials, surface water and catch basin sediments. Concentrations of PCBs in soil were noted to be higher than 1,900 ppm. Remediation has reportedly been performed that includes the demolition of existing structures and the removal of PCB-
impacted soils from both on-site and off-site (including from four residential yards). The site description concludes by noting that “one final area of the site will be excavated and backfilled with clean oil in 2002. An exposure assessment and a fish and wildlife impact analysis for the off-site mudflat area are in progress.”

**g. Major Oil Storage Facilities (MOSF) Database**

These facilities may be on-shore facilities or vessels with petroleum storage capacities of 400,000 gallons or more.

There were no Major Oil Storage Facilities reported within a one-mile radius of the subject property.

**i. Brownfields Sites**

New York State Brownfield Cleanup Sites are abandoned, idled or under-used industrial and commercial sites where expansion or redevelopment is complicated by real or perceived environmental contamination. The Voluntary Cleanup Program (VCP) is the predecessor program to the Brownfield Cleanup Program (BCP), both of which are administered by NYS DEC.

One VCP site was listing within a ½-mile radius of the subject property. The Cedar Street Manufactured Gas Plant (MGP) site, located at One Ramada Plaza, approximately 1,222 feet northwest of the subject property was listed as being in the VCP. The site is a former Con Edison MGP that operated between 1863/68 and 1931; the site is currently an auto dealership. The listing indicated that a site characterization work plan was approved by NYS DEC in December 2005 and field work was anticipated to begin in March 2006.

Two BCP sites were listed within a ½-mile radius of the subject property. Flamingo Cleaners, located at 149 North Avenue, approximately 1,704 feet southwest of the subject property, was listed as being in the BCP. Information provided in the listing indicated that the site contains a dry cleaning establishment. Investigations performed to date have reportedly identified various chlorinated solvents, including common dry
cleaning solvents, and volatile organic compounds in soil and groundwater. The listing notes that a Phase I ESA was performed in October 2003 and subsurface testing was performed in March of 2004 and again in March of 2006. The listing indicates that investigation may still be ongoing at this time.

Schmuckler's Dry Cleaning, located at 358-364 North Avenue, approximately 2,565 feet west of the subject property, was listing as being in the BCP. Information provided in the listing indicated that the site has contained an operational dry cleaning establishment since 1914 and that dry cleaning chemicals were detected in subsurface soil behind the dry cleaner. The listing indicated that an application was submitted to NYS DEC to enter the site into the BCP, however, the application was deemed incomplete by the State. The listing indicated that a BCP agreement was being negotiated in March 2006.

j. Institutional Controls/Engineering Controls

U.S. EPA defines Institutional Controls (ICs) as actions, such as legal controls, that help minimize the potential for human exposure to contamination by ensuring appropriate land or resource use. Engineering Controls (ECs) eliminate or reduce exposure to a chemical or physical hazard through the use or substitution of engineered machinery or equipment. US EPA and individual state agencies regularly implement ICs and ECs on sites that are being investigated and/or remediated through federal or state programs.

A review of NPL sites, CERCLIS sites, Inactive hazardous Waste Disposal Sites and Brownfields Sites did not indicated any ICs or ECs on the subject property or adjacent properties.

G. Freedom of Information Law Requests

On January 31, 2007, ELM sent Freedom of Information Law (FOIL) request to the United States Environmental Protection Agency (EPA), the New York State Department of Environmental Conservation (NYS DEC), New York State Department of Health (NYS DOH), the City of New Rochelle Fire Department, and the City Clerk of New Rochelle for the subject property and for properties east- and west-adjacent to the
subject property. Each agency was provided a list of Block and Lot numbers and corresponding physical addresses (as provided by the Tax Assessor’s office) for the individual lots that comprise the search area. From each agency, ELM requested any information or copies of files regarding environmental conditions, such as environmental permits, notices of violations, spill/discharge incidents, storage or disposal of hazardous substances, Underground Storage Tanks (USTs), Leaking Underground Storage Tanks (LUSTs), asbestos abatement and any other environmental reports. The sections below document the responses received by individual agencies up until production of this report. If additional responses to our request are received after report production, and if relevant information pertaining to the subject property is revealed, an Addendum to this Phase I Environmental Site Assessment will be issued. Please see Attachment H for a copy of the FOIA request and documents received.

1. **US EPA**

In response to ELM’s FOIL request dated January 31, 2007, US EPA issued an acknowledgement of receipt of ELM’s request dated February 5, 2007. On February 15, 2007, US EPA issued a letter from their RCRA Programs Branch indicating that no hazardous waste (RCRA) information was identified for any of the requested properties. ELM received a second letter dated February 15, 2007 from the Emergency and Remedial Response Division that indicates that none of the subject sites were listed on the CERCLIS or NFRAP lists. A third letter was received dated March 9, 2007 from the Compliance Assistance and Program Support Branch, noting that no air or water information was identified in connection with our search request.

2. **NYS DEC**

In response to ELM’s FOIL request dated January 31, 2007, ELM received a letter from NYS DEC Region 3 Records Access Office dated February 2, 2007 stating that our request had been forwarded to T. Ghiosay of the Spill Prevention and Response Program. This letter included NYS DEC Spill Record Sheets for 29 spills that presumably occurred within the search area, although the letter did not state as such. As stated above, the search area included lots on the subject property and lots to the east and west of the
subject property. As such, ELM sorted through the records provided and determined that 4 of the Spill Record Sheets pertain to the former Marina on Lot 0110, all of which have been administratively closed. The spills listings generally document a history of petroleum releases to Echo Bay from storm drains or pipes leading into the Bay. Closed status spill listings have reportedly been remediated to the satisfaction of NYS DEC. As such, it is unlikely that any closed status spill listings are currently impacting soil or groundwater conditions on the subject property.

NYS DEC/Region 2 issued a letter dated March 6, 2007 indicating that no records were located for the properties requested. The letter notes that NYS DEC/Region 2 files their records by number under the names of individuals or corporations, not under addresses.

3. **NYSDOH**

In response to ELM’s FOIL request dated January 31, 2007, NYS DOH issued an acknowledgement of receipt of ELM’s request dated February 2, 2007. ELM also received a letter dated February 28, 2007 from NYS DOH noting that an inactive hazardous waste site is currently located on Block 84, Lot 0073, 78 Echo Avenue. This property is located adjacent to the subject property on parcel Phase 1(b). The letter indicates that it would cost ELM $256.50 for NYS DOH to copy all 1,026 pages of available documentation and provide them to ELM. It is ELM’s understanding that documents relating to the investigation and remediation on the property located at 78 Echo Avenue are forthcoming directly from the property owner. If these documents provide information relating to recognized environmental conditions on Lots 0005, 0022 or 0110, an Addendum to this Phase I ESA will be issued.

4. **City of New Rochelle Fire Department**

No response has been received from the City of New Rochelle Fire Department to ELM’s FOIL request dated January 31, 2007. On May 3, 2007, ELM personnel visited the City of New Rochelle Fire Department headquarters and viewed available files pertaining to underground and aboveground storage tanks on the three lots that comprise the subject
property. Records were only on-file for Lot 0005. Results of this research are presented below. Please see Attachment I for copies of Fire Department records.

**Lot 0005**

The following listings were reviewed for Lot 0005:

- A record dated December 14, 1961 for the storage of 2,000-gallons of #2 Fuel Oil in an underground storage tank. The tank is noted to be located in the “New Sewers & Drains bldg. Old repair garage. Boiler room on garage at rear of bldg.”

- A record dated December 14, 1961 for the storage of 3,000-gallons of #4 fuel oil in an underground storage tank. A notation on this listing indicated that this tank was removed on April 2002.

- A record dated December 14, 1961 for the storage of 550-gallons of #2 fuel oil in a cellar. The tank is noted to be located in the Administration bldg, which front Main Street.

- A record dated March 2, 1970 for the storage of 5,000-gallons of #4 Fuel Oil in an underground storage tank. The tank is noted to be located in the “New Repair Garage.” The tank was reportedly tested in 2004 and again in 2007.

- A record dated November 4, 2004 for the removal of four 1,000-gallon underground motor oil storage tanks. A Petroleum Tank Closure Form also documented the closure of these four tanks. This form noted that the site was not free of contamination after the tank removal.

- An undated Petroleum Tank Closure Form documented the removal of one 4,000-gallon underground storage tank. This form noted that the site was not free of contamination after the tank removal.

- An Installation and/or Modification of Petroleum Bulk Storage Tanks Form dated June 30, 2004 notices the installation of two 4,000-gallon tanks. No information was provided as to whether these tanks were aboveground or underground and no information was provided regarding tank contents.
- A record dated December 11, 2006 references a fuel oil burner connected to a 3,000-gallon aboveground storage tank located in the “Stone Storage bldg. attached to old stone storage garage.”

- A Tightness Test Report dated March 2, 2005 documented the testing of one 5,000-gallon #2 fuel oil underground storage tank. The report documented that the tank was found to be tight.

- A Westchester County Department of Health Petroleum Bulk Storage Registration Certificate issued April 2, 1998 listed the following tanks for Lot 0005:
  - One 3,000-gallon tank associated with Spill No. 9803810 which was removed in April 2002;
  - Four 1,000-gallon tanks;
  - One 5,000-gallon tank;
  - Three 2,000-gallon tanks that were removed in April 1998. Two of the tanks were noted to be associated with Spill Nos. 9803810 and 9713578.

- A letter dated June 4, 1998 from the City of New Rochelle Department of Public Works to the New York State Department of Environmental Conservation (NYS DEC) regarding Spill No. 9800763 indicated that an oil water separator would be collected to all floor drains in the garage and to the sanitary sewer system, a 2,000-gallon tank that failed an integrity test has been removed and soil beneath the tank was tested and data was presented to NYS DEC (the letter did not indicate if the soil was contaminated).

- A letter dated March 17, 1998 from ProTest Enterprises to the City of New Rochelle documented the testing of seven tanks located in New Rochelle; three of the tanks were located on Lot 0005. The tanks that were tested that were located on Lot 0005 are as follows:
  - One 5,000-gallon diesel underground storage tank;
  - One 5,000-gallon #2 fuel oil underground storage tank;
5. **City Clerk of New Rochelle**

At the time of publication of this report, no response has been received from the City Clerk of New Rochelle to ELM’s FOIL request dated January 31, 2007.

H. **City of New Rochelle Department of Buildings**

ELM contacted Mr. Noel Shaw, Jr., Building Officer at the New Rochelle Buildings Department via electronic mail. Mr. Shaw directed ELM personnel to NYS DEC for records pertaining to spills and to the New Rochelle Fire Department for records pertaining to storage tanks.

A complete set of City of New Rochelle Department of Buildings records for Lots 0005, 0022 and 0110 was provided to ELM by Forest City Residential Group. These records did not provide any information relating to possible environmental conditions on the subject properties.

I. **Tribal Records**

The subject property is not located on or adjacent to tribal lands, and therefore, a search of tribal environmental records was not conducted or required pursuant to ASTM-1527-05.

J. **ASTM Interview**

Several people were interviewed with regards to the subject property. A summary of the interviews is provided below. Copies of interview forms and the ASTM questionnaire are provided in Attachment J.

1. **Lot 0005**

On March 8, 2007, Joseph Cotroneo and Richard Fevang, Deputy Commissioner and Fleet Manager, respectively, of the Department of Public Works (DPW) were
interviewed regarding Lot 0005. The Department of Public Works is currently the sole tenant of Lot 0005. These gentlemen provided the following information pertinent to this report:

- The City of New Rochelle Department of Public Works has occupied Lot 0005 since approximately 1917, around the time that most of the existing buildings on-site were constructed. A corrugated metal garage was added to the southern portion of the Lot in the mid-1960s.

- The Lot is currently solely occupied by the City of New Rochelle Department of Public Works. The Lot is currently used for the repair and maintenance of all city-owned vehicles, with the exception of Fire Department vehicles. All vehicle repair occurs in the corrugated metal garage in the southern portion of the Lot.

- Current petroleum USTs and ASTs operate on the subject Lot. Several USTs have previously been removed from the Lot. Please see Section II.A. for more information.

- Petroleum-contaminated soil and groundwater was found to be associated with petroleum-storage tanks on the subject Lot. Efforts to remediate the on-site petroleum releases in conjunction with NYS DEC are ongoing. Mr. Cotroneo and Mr. Fevang deferred to another DPW personnel, Kaz Orszulik, for more information regarding investigation and remediation efforts on Lot 0005. Please see below for results of an interview with Kaz Orszulik and see Section IV for results of previous studies performed on Lot 0005.

- An oil water separator currently exists on-site. The oil in the separator is pumped out on an as-needed basis by a private hauler and is disposed of off-site.

- A self-contained parts cleaner operates on the Lot. The machine contains mineral spirits. The cleaner is capable of burning off filtered impurities and recycling the mineral spirits.
On April 5, 2007, Kaz Orszeulik, Senior Engineer for DPW, was interviewed regarding the history of tanks and of investigation/remediation on Lot 0005. Kaz Orszeulik offered the following pertinent information:

- Mr. Orszeulik confirmed the number, size and contents of USTs that had been removed from the ground. Mr. Orszeulik also confirmed the number, size and contents of tanks that currently operate on Lot 0005. Please see Section II.A. for more information.

- Mr. Orszeulik stated that he is in charge of site investigation and remediation for Lot 5 and said that he has been coordinating all such work with Todd Ghiosay of NYS DEC. Mr. Orszeulik stated that many spill releases had been reported to NYS DEC over the years. Mr. Orszeulik said that most of the spill releases have been closed and consolidated into two or three listings.

- In 1998 and 2001, one 5,000-gallon diesel UST and one 5,000-gallon gasoline UST were removed from north of the corrugated metal garage on the southern portion of the site. Contaminated soil was discovered during tank removal. In an effort to investigate the contamination, Hydra Environmental Services was retained to install 6 soil borings/groundwater monitoring wells in this area. Petroleum-contaminated soil and groundwater were discovered as a result of this investigation, which was performed in 2001.

- Mr. Orszeulik stated that NYS DEC has asked for additional investigation north of the corrugated metal garage and that NYS DEC has required that an investigation work plan be submitted to them by April 28, 2007.

- In 2003, two ASTs (1 diesel and 1 gasoline) were installed northeast of the corrugated metal garage. During the installation of underground piping from the ASTs to pump islands located east of the corrugated metal garage building, contaminated soil and remnants of a foundation for a former sewer pump station were discovered. According to Mr. Orszeulik, the concrete remnants of the
foundation act as a sink for oil in this area. In an attempt to remediate this area, in 2004 Schoor DePalma installed 3 or 4 monitoring wells as part of an air sparging system. NYS DEC halted the operation of the air sparging system until soil is first investigated and remediated in this area.

- In 2006, EMI was retained to test soil and groundwater in the vicinity of the foundation of the former sewer pump station. DPW is currently conducting a competitive bid process to select a contractor to remove contaminated soil from the vicinity of the former sewer pump station. Mr. Orszeulik expects this work to occur before the end of 2007.

Mr. Orszeulik provided several previous studies and other relevant documentation for review. Please see Section IV for a summary of these studies.

2. *Lot 0022*

Mr. John Malycyky, an employee of Habitat for Humanity, was interviewed regarding Lot 0022 on March 8, 2007. Habitat for Humanity is the only active tenant on Lot 0022 at this time. The main building on the site is occasionally used for the filming of movies and by the City of New Rochelle for an annual Halloween haunted house. Habitat for Humanity stores building materials in the corrugated metal building in the southern portion of the site and on paved and landscaped areas on the Lot.

Mr. Malycyky offered the following information:

- Habitat for Humanity has occupied a portion of Lot 0022 for the last six years.

- Habitat for Humanity does not store, use or generate any petroleum products or hazardous materials on Lot 0022.

On March 8, 2007, Anthony Galetta of Friends of the Armory, provided a completed Interview Questionnaire to ELM electronically. Friends of the Armory is a citizens group dedicated to ensuring re-adaptive public use of the armory building on Lot 0022.
Mr. Galetta provided the following information:

- The main two-story brick and concrete building on Lot 22 was completed in 1931. The property was originally used as a Naval Armory.

- The property was transferred to the City of New Rochelle in 1997. Since 1997, the property has been used for 9-11 relief efforts as a transfer station for staple goods, for filming television shows, for police and fire training, for an annual haunted house and by Habitat for Humanity.

3. **Lot 0110**

Ms. Suzanne D'Amato, Senior Project Manager for the City of New Rochelle, was interviewed regarding Lot 0110. Ms. D'Amato stated that the Lot was formerly operated by the City of New Rochelle as a marina. Ms. D'Amato did not offer any other additional pertinent information. Lot 0110 is currently unoccupied.

4. **User Furnished Information Questionnaire**

The Questionnaire in Appendix X3 to ASTM Standard 1527-05 was provided to the User of this Phase I ESA, Forest City Residential Group, Inc. George Kruse of Forest City Residential Group, Inc. answered all pertinent questions. In an answer to a question on the Questionnaire, Mr. Kruse indicated that the fair market value of the subject property was not adjusted due to knowledge of contamination at the property. Please see Attachment J for the ASTM Questionnaire.

IV. **PREVIOUS STUDIES AND OTHER DOCUMENTATION**

Previous studies and other relevant documentation were available for review on Lots 0005, 0022, and 0110. Below are summaries of findings from ELM’s review of available documentation by Lot. Please see Attachment K for copies of these documents.
A. Lot 0005

Kaz Orszeulik, Senior Engineer with the City of New Rochelle Department of Public Works, and Suzanne D'Amato, Senior Project Manager for the City of New Rochelle Department of Development, provided the following documentation for Lot 0005:

1. UST Closure Report – May 21, 2002

A report entitled *UST Closure Report* was prepared for the City of New Rochelle by Ira D. Conklin & Sons, Inc. and dated May 21, 2002. The report documented the removal of one 2,500-gallon waste oil UST from south of the corrugated metal garage building in April 2002. The scope of work performed by the contractor included the excavation and removal of the UST, scanning of the soil with a photoionization detector (PID) to determine volatile organic vapor levels, and the collection of post-excavation samples from the UST excavation for laboratory analysis for NYS DEC Spill Technology and Remediation Series (STARS) Memorandum No. 1 volatile organic compounds (VOCs) (EPA Method 8260) and semivolatile organic compounds (SVOCs) (EPA Method 8270) and RCRA Metals.

The report noted that the tank was encountered approximately four feet below grade and it was reportedly strapped to a concrete pad in the bottom of the excavation. The report indicated that the tank was in poor condition, with pitting and corrosion present; no penetrations were reportedly observed. Groundwater was not encountered during the excavation. No PID readings were reported within the UST excavation. Two samples were collected for laboratory analysis: one composite sample from the excavation walls and one grab sample from the bottom of the excavation. Results indicate that no VOCs were detected in either sample at concentrations above NYS DEC Technical and Administrative Guidance Memorandum (TAGM) 4046 Recommended Soil Cleanup Objectives (RSCOs). Four SVOCs were detected above TAGM RSCOs in each of the soil samples: benzo(a)anthracene, benzo(b)fluoranthene, benzo(k)fluoranthene and chrysene. The total concentration of SVOCs in the soil sample collected from the excavation sidewalls was 6.6 ppm, and the total
concentration of SVOCs in the soil sample collected from the excavation bottom was 9.5 ppm, both far below the TAGM RSCO of 500 ppm.

The report references the following NYS DEC Petroleum Bulk Storage Number for the site: 3-600405. ELM cross-checked this PBS number with NYS DEC PBS database. While there is a PBS listing for Lot 0005, it does not reference the removal of a 2,500-gallon waste oil tank.

The report recommends that a passive course of remediation utilizing natural attenuation be followed.

2. **Figure – Groundwater Monitoring System at Garage – March 6, 2002**

A figure was prepared by the City of New Rochelle entitled “Groundwater Monitoring System at City Garage” and dated March 6, 2002. Mr. Orszeulik informed ELM personnel that he prepared this figure to document the approximate location of groundwater monitoring wells on the site that were installed as part of the Hydra Environmental Services subsurface investigation in 2001. The figure indicates that 6 wells were installed north and east of the corrugated metal garage that is located on the southern portion of Lot 0005. The figure also shows the location of the following:

- One waste oil UST that was removed from south of the corrugated metal garage building;
- One diesel UST and one gasoline UST that were removed from north of the corrugated metal garage building;
- One “new” gasoline AST and one “new” diesel AST located northeast of the corrugated metal garage building;
- One “new” oil water separate located north of the corrugated metal garage building; and
• The abandoned sewer pump station located east of the corrugated metal garage building. A notation on this structure states that product was removed and the structure was partially backfilled.

3. **Brownfields Site Background Memorandum for City Yard – March 2003**

A document entitled *Draft Brownfields Site Background Memorandum for New Rochelle City Yard, 224 East Main Street, New Rochelle, New York* was prepared by Foster Wheeler Environmental Corporation (Foster Wheeler) under an EPA contract and dated March 2003. The objectives of the Memorandum were to determine the nature and extent of contamination on-site, to determine the risks posed by the contamination, to determine the potential remedial alternatives to minimize continued risk to human health and/or the environment, and to estimate costs of identified cleanup options in the scope of site redevelopment. The scope of work for the Memorandum included the evaluation of existing data and documents, a review of an environmental regulatory database search, and the performance of interviews with property owners and occupants of the site.

The Memorandum reviewed two previous studies and a scope of work for site remediation, all of which were included as attachments to the Memorandum:

• **A Phase I Environmental Site Assessment, performed by HILL International, Inc. and dated November 1994.** The Phase I ESA documents that Lot 0005 has been used by the New Rochelle Department of Public Works since 1917. The property was used as a boat house and ice house prior to 1917. A sewage disposal plant was formerly present on the site circa 1911. HILL identified the following environmental concerns associated with Lot 0005:
  
  o Site activities that involve the use of petroleum and other contaminants. Such uses were principally associated with vehicle cleaning and repair, but also insecticide, weed killer, paint and paint solvent use.
o The appearance of soils in topographic lows, especially where pavement is absent, and the historic use of the site for the storage and maintenance of vehicles suggest the possibility of a buildup of petroleum hydrocarbons and other contaminants in soil in localized areas.

o As many as 14 tanks (two of which were ASTs).

- **A Report of Groundwater and Soil Investigation for Petroleum Contamination**, performed by HydroEnvironmental Solutions, Inc. (HES) and dated August 2002. This report summarized a subsurface testing program that included the advancement of seven borings, the installation of groundwater monitoring wells in boring locations, the collection of soil and groundwater samples for laboratory analysis and permeability testing at each monitoring well. HES concluded that dissolved and adsorbed benzene, toluene, ethylbenzene and total xylene (BTEX) compounds were present in soils and groundwater beneath the site. Free-phase liquid hydrocarbon was documented in one monitoring well. The majority of petroleum contamination was reported to be located along the westerly portion of Lot 0005. The report noted that a buried seawall and moderate to low hydraulic conductivity may be impending downgradient hydrocarbon transport. HES suggested that remedial alternatives for site cleanup included soil vapor extraction (SVE), dual phase high vacuum extraction (DPHVE) and/or air sparging. A pilot study was recommended to determine the most suitable remedial alternative. The following additional recommendations were made: perform quarterly groundwater monitoring, conduct weekly free-phase product collection, and perform additional investigation to determine the documented spill on the bedrock aquifer.

- **A Scope of Work for Consulting Services for Site Remediation of Contamination at City Yard**, prepared by Schoor DePalma, Inc. and dated January 13, 2003. This scope of work identified that the main source of petroleum contamination on Lot 0005 was three former USTs containing
gasoline, diesel fuel and waste oil that were removed from the site in 1998, 2001 and 2002. The scope suggests that a sump from a former sewer pump station is present on site at a depth of 30 feet below grade and that the sewer pump could be an ongoing source of groundwater contamination. The scope noted that product and contaminated water were pumped from this sump in 2001. The actual scope of work proposed in the document included conducting a pilot study and preparing a design of a remediation system for the site, constructing/installing the remediation system and providing construction inspection services and a report on the effectiveness of the system.

The Memorandum identified the following areas of concern for Lot 0005:

- **Impacted soil and groundwater.** The Memorandum reports that a 2,000-gallon gasoline UST failed at the facility and a soil and groundwater investigation concluded that dissolved and adsorbed benzene, toluene, ethylbenzene and xylene (BTEX) compounds were present in the soils and groundwater beneath the property. In addition, the Memorandum notes that approximately 1,400 gallons of free product were pumped out of the former sewer pump located east of the corrugated metal garage building. The Memorandum reports that the City of New Rochelle is undertaking the design and construction of a remediation system.

- **Consolidated Edison property.** The Memorandum notes that a former Consolidated Edison substation was located on Lot 0073 and that an active PCB remediation was occurring on that site. The Memorandum recommends testing of soil and sediment for PCBs along the Echo Bay shoreline adjacent to Lot 0005.

- **Spills.** The Memorandum cites seven spills were reported to have occurred on Lot 0005. The Memorandum recommends that additional research be performed regarding said spills.
- **USTs.** The Memorandum notes that up to 12 USTs may be present on site. The Memorandum recommends that the location of these USTs be determined and any closure reports be obtained and reviewed. The Memorandum also recommends soil and groundwater testing in the vicinity of said tanks.

- **ASTs.** The Memorandum reports that three in-service ASTs are present at the facility and recommends that, if stained surfaces are observed in the vicinity of said tanks, soil sampling be performed.

- **Site history.** The Memorandum notes that the site history suggests the possibility that soil and groundwater conditions may have been impacted by site operations utilizing petroleum hydrocarbons or other contaminants.

- **Transformer.** The Memorandum reports that a transformer is present between two garages on-site and recommends that, if stained surfaces are observed in the vicinity of said transformer, soil sampling be performed.

- **Lead-based paint (LBP) and asbestos-containing building materials (ACBM).** The Memorandum notes that, due to the age of on-site structures, both LBP and ACBM could be present on-site. The Memorandum recommends testing of suspect materials.

- **Drains.** The Memorandum recommends that, if drains are present within the facility structures, discharge points for any identified drains be determined and samples be collected in the drain and at the discharge location.

- **Non-native fill.** The Memorandum notes that the original shoreline of Echo Bay was historically extended into Echo Bay through the use of fill material of unknown origin. The Memorandum recommends sampling of such fill material.
4. **Revised Site-Specific Field Sampling Plan – November 21, 2003**

A document entitled *Revised Site-Specific Field Sampling Plan* was prepared by Foster Wheeler under an EPA contract and dated November 21, 2003. Based on the findings of the *Draft Brownfields Site Background Memorandum* and a subsequent site inspection performed by Foster Wheeler, the *Revised Site-Specific Field Sampling Plan* presents 30 areas of concern and recommends further investigation for 28 of the 30 areas. Recommended further investigation included the advancement and sampling of soil borings, the collection and analysis of sediment samples from floor drains and dye testing to determine outfalls of drains, the collection of samples of debris piles, and the collection of sediment samples from Echo Bay. The cover letter to the *Revised Site-Specific Field Sampling Plan* indicated that groundwater sampling had been eliminated from the proposed scope of work at the request of EPA.

The City of New Rochelle has reported that the sampling program proposed in the *Revised Site-Specific Field Sampling Plan* was never performed.

A report entitled *Remedial Feasibility Test Summary Report, 224 Main Street, New Rochelle, NY* was prepared by Groundwater & Environmental Services, Inc. for Schoor DePalma and dated January 25, 2005. The remedial feasibility test included the performance of soil vapor extraction (SVE) tests on three wells (MW-1, MW-2 and MW-3) and the performance of air sparge/SVE tests on two of the same wells (MW-1 and MW-2) located north and east of the corrugated metal garage building in the southern portion of Lot 0005. The stated purpose of the remedial feasibility test was to verify the effectiveness of the proposed remedial action technologies on the hydrocarbon impacted soil and groundwater at the site and to collect data necessary to prepare the final system design specifications.

The report concludes that the site is suitable for SVE technology in the vicinity of two of the three monitoring wells (MW-2 and MW-3, both located east of the corrugated metal garage building). The report concluded that the two wells tested (MW-1, located north of
the corrugated metal garage building, and MW-2) are not suitable for air sparging technology. The report suggests that additional remedial technologies may be necessary to address groundwater impacts on the site.

A figure contained in the report indicates the presence of groundwater monitoring wells numbered up to MW-11. The first six wells (MW-1 through MW-6) were shown to be located in approximately the same locations as the wells located in the City of New Rochelle “Groundwater Monitoring System at City Garage” Figure from 2002. This implies that supplemental well installation occurred between March 2002 and the performance of the Remedial Feasibility Test in 2004/2005.

The report referenced Spill No. 98-03810, a spill number that was listed as having been closed with NYS DEC in 2003. Information provided in the spill listing referenced a waste oil tank removal performed by Ira D. Conklin & Sons.

6. CHEMTECH Laboratory Data Package – June 14, 2006

A laboratory data package prepared by CHEMTECH laboratory of Mountainside, NJ for sample Basement-Groundwater (Lab ID No. X3102-01) and dated June 14, 2006 was reviewed. According to Mr. Orszeulik, this sample was collected from within the abandoned sewer pump station located east of the corrugated metal garage building. The Basement-Groundwater sample was a liquid sample collected on June 3, 2006 for STARS VOCs and chloride analysis. The data indicate that the sample was analyzed two times for VOCs.

When comparing the detected concentrations to NYS DEC Technical and Operational Guidance Series (TOGS) Class GA Drinking Water Guidance Values and Standards, the following VOCs were detected in excess of these criteria in one or both of the analysis performed on the Basement-Groundwater sample: MTBE, benzene, toluene, ethylbenzene, m/p xylenes, o xylene and naphthalene. The detected concentration of chloride was 2,600,000 ppb. The Class GA Standard for chloride is 250,000.
A page summarizing laboratory analysis of two soil samples entitled “Soil Analytical Results, City of New Rochelle, City Yard – Basement” were attached to the CHEMTECH laboratory data package. According to Mr. Orszeulik, these samples were also collected from within the abandoned sewer pump station located east of the corrugated metal garage building. The data appears to have been compared to NYS DEC TAGM RSCOs, however, the comparison criteria is not specified on the table. The data presented in the tables indicate that several VOCs and SVOCs were detected above TAGM RSCOs, including benzene; ethylbenzene; xylene; isopropylbenzene; n-propylbenzene, 1,3,5-trimethylbenzene, 1,2,4-trimethylbenzene, 4-isopropylbenzene, n-butylbenzene, sec-butylbenzene, naphthalene, benzo(a)anthracene and benzo(b)fluoranthene.

B. Lot 0022

Suzanne D’Amato, Senior Project Manager for the City of New Rochelle Department of Development, provided the following documentation for Lot 0022:

1. Brownfields Site Background Memorandum for New Rochelle City Armory – March 2003

A document entitled Draft Brownfields Site Background Memorandum for New Rochelle City Armory, 270 Main Street, New Rochelle, New York was prepared by Foster Wheeler Environmental Corporation (Foster Wheeler) under an EPA contract and dated March 2003. The objectives of the Memorandum were to determine the nature and extent of any contamination on-site, to determine the risks posed by the contamination, to determine the potential remedial alternatives to minimize continued risk to human health and/or the environment, and to estimate costs of identified cleanup options in the scope of site redevelopment. The scope of work for the Memorandum included the evaluation of existing data and documents, a review of an environmental regulatory database search, and the performance of interviews with property owners and occupants of the site.

The Memorandum identified the following areas of concern for Lot 0022:
• **SPILLS.** One spill was reported for the Marina formerly located on Lot 0110. The Memorandum recommended that supplemental information regarding the site spills be reviewed and that soil and groundwater sampling be performed in the vicinity of identified spills.

• **AST.** The Memorandum reported that an AST was present on Lot 0022 and recommended soil sampling if any stained areas were observed in the vicinity of the AST during a site inspection.

It should be noted that, although not discussed as a conclusion to the Memorandum, the text of the document discusses the presence of a vaulted fuel oil UST on site.

• **Non-native fill.** The Memorandum notes that the original shoreline of Echo Bay was historically extended into Echo Bay through the use of fill material of unknown origin. The Memorandum recommends sampling of such fill material.

• **Transformer.** The Memorandum recommends that if transformer(s) are present at the property and stained areas are observed in the vicinity of the transformer(s) during a site inspection, soil sampling should be performed. It should be noted that the scope of work performed for the Memorandum did not indicate the presence of transformer(s) on-site; this scope of work did not include a site inspection.

• **Lead-based paint (LBP) and asbestos-containing building materials (ACBM).** The Memorandum notes that, due to the age of on-site structures, both LBP and ACBM could be present on-site. The Memorandum recommends testing of suspect materials.

• **Drains.** The Memorandum recommends that, if drains are present within the facility structures, discharge points for any identified drains be determined and samples be collected in the drain and at the discharge location.
• **Adjacent properties.** The Memorandum notes that a former Consolidated Edison substation (Lot 0073) and the New Rochelle City Yard (Lot 0005), where seven spills were reported, were located in the area surrounding the project site. The Memorandum recommends testing soil, groundwater and sediment samples from Echo Bay to evaluate potential impacts to Lot 0110 from these sites.

2. **Revised Site-Specific Field Sampling Plan – November 21, 2003**

A document entitled *Revised Site-Specific Field Sampling Plan* was prepared by Foster Wheeler under an EPA contract and dated November 21, 2003. Based on the findings of the *Draft Brownfields Site Background Memorandum* and a subsequent site inspection performed by Foster Wheeler, the *Revised Site-Specific Field Sampling Plan* presents 13 areas of concern and potential areas of concern and recommends further investigation for 10 of the 13 areas. Recommended further investigation included the advancement and sampling of soil borings and the collection of surface soil samples, the collection and analysis of sediment samples from floor drains and dye testing to determine outfalls of drains, and the collection of sediment samples from Echo Bay. The cover letter to the *Revised Site-Specific Field Sampling Plan* indicated that groundwater sampling had been eliminated from the proposed scope of work at the request of EPA.

The City of New Rochelle has reported that the sampling program proposed in the *Revised Site-Specific Field Sampling Plan* was never performed.

C. **Lot 0110**

Suzanne D’Amato, Senior Project Manager for the City of New Rochelle Department of Development, provided the following documentation for Lot 0110:

1. **Brownfields Site Background Memorandum for Mancuso Marina – March 2003**

A document entitled *Draft Brownfields Site Background Memorandum for Mancuso Marina, Huntington Place, New Rochelle, New York* was prepared by Foster Wheeler Environmental Corporation (Foster Wheeler) under an EPA contract and dated March
2003. The objectives of the Memorandum were to determine the nature and extent of any contamination on-site, to determine the risks posed by the contamination, to determine the potential remedial alternatives to minimize continued risk to human health and/or the environment, and to estimate costs of identified cleanup options in the scope of site redevelopment. The scope of work for the Memorandum included the evaluation of existing data and documents, a review of an environmental regulatory database search, and the performance of interviews with property owners and occupants of the site.

The Memorandum identified the following areas of concern for Lot 0110:

- **SPILLS.** Two spills were reported for the Marina formerly located on Lot 0110. The Memorandum recommended that supplemental information regarding the site spills be reviewed and that soil and groundwater sampling be performed in the vicinity of identified spills.

- **Non-native fill.** The Memorandum notes that the original shoreline of Echo Bay was historically extended into Echo Bay through the use of fill material of unknown origin. The Memorandum recommends sampling of such fill material.

- **Site history.** Lot 0110 was reportedly used as a boat yard since the early 1900s. As such, repair work on motors would involve petroleum products and solvents. In addition, the possibility of hazardous materials, including paints, epoxies and solvents were reportedly used. The Memorandum recommends that soil sampling be performed if stained areas are observed during a site inspection.

- **Transformer.** The Memorandum recommends that if transformer(s) are present at the property and stained areas are observed in the vicinity of the transformer(s) during a site inspection, soil sampling should be performed. It should be noted that the scope of work performed for the Memorandum did not indicate the presence of transformer(s) on-site; this scope of work did not include a site inspection.
• **Lead-based paint (LBP) and asbestos-containing building materials (ACBM).** The Memorandum notes that, due to the age of on-site structures, both LBP and ACBM could be present on-site. The Memorandum recommends testing of suspect materials.

• **Drains.** The Memorandum recommends that, if drains are present within the facility structures, discharge points for any identified drains be determined and samples be collected in the drain and at the discharge location.

• **Adjacent properties.** The Memorandum notes that a former Consolidated Edison substation (Lot 0073) and the New Rochelle City Yard (Lot 0005), which reportedly contained a failed UST, were located in the area surrounding the project site. The Memorandum recommends testing soil, groundwater and sediment samples from Echo Bay to evaluate potential impacts to Lot 0110 from these sites.

2. **Revised Site-Specific Field Sampling Plan – November 21, 2003**

A document entitled *Revised Site-Specific Field Sampling Plan* was prepared by Foster Wheeler under an EPA contract and dated November 21, 2003. Based on the findings of the *Draft Brownfields Site Background Memorandum* and a subsequent site inspection performed by Foster Wheeler, the *Revised Site-Specific Field Sampling Plan* presents 11 areas of concern and potential areas of concern and recommends further investigation for 10 of the 11 areas. Recommended further investigation included the advancement and sampling of soil borings and the collection of surface soil samples and the potential collection of sediment samples from Echo Bay. The cover letter to the *Revised Site-Specific Field Sampling Plan* indicated that groundwater sampling had been eliminated from the proposed scope of work at the request of EPA.

The City of New Rochelle has reported that the sampling program proposed in the *Revised Site-Specific Field Sampling Plan* was never performed.
V. EXCEPTIONS OR DELETIONS FROM ASTM E-1527-05

No exceptions to, or deletions from, the Phase I Environmental Site Assessment ASTM E-1527-05 practice were made in completion of this report, except for the following limiting conditions:

- A one-story garage and storage shed located on Lot 0022 were inaccessible at the time of the site inspection; and

- The lights inside of the large, three-story, brick-structure with a basement in the northern portion of Lot 0022 did not completely illuminate the site for the purposes of the site inspection. As such, it was difficult, at times, to clearly view property features (for example, concrete flooring for evidence of cracks).

These limitations do not present data gaps that are significant enough to preclude the environmental professional from identifying recognized environmental conditions for the subject property.

VI. CONCLUSIONS

Environmental Liability Management of New York, LLC (“ELM”) completed a Phase I Environmental Site Assessment (“ESA”) for the property referred to as Echo Bay Redevelopment, Parcel Phase I(a). The legal definition of the property is Section 1, Block 84, Lots 0005, 0022 and 0110, New Rochelle, New York (the “subject property” or “property”). The property is approximately 10.62 acres in size and is bound by Main Street to the north, commercial uses to the east and west, and Echo Bay to the south.

The Phase I ESA was completed in conformance with the scope and limitations of American Society for Testing and Materials (“ASTM”) Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process Standard E1527-05. This Phase I ESA included a site inspection of the subject property and the adjacent and surrounding properties; a review of environmental agencies’
databases; performed FOIL inquiries with City, State, and Federal agencies and reviewed received documentation; a review of historical topographic photographs, historical aerial photographs, Sanborn Fire Insurance Maps and city directories; the performance of an environmental lien search; a review of previous studies; and interviews with property owners and others familiar with operations at the site.

The objective of the environmental assessment was to identify, to the extent feasible pursuant to the ASTM Standard 1527-05, Recognized Environmental Conditions ("RECs") in connection with the property. Any exceptions to, or deletions from, this practice are discussed in Section IV of this report.

This assessment has revealed RECs in connection with the subject property.

The following RECs were identified specific to a single Lot:

**Lot 0005 - 220 – 224 East Main Street**

Lot 0005 was historically occupied by a boat yard (circa 1911) and by the Department of Public Works circa 1917 through the present. The lot currently contains several interconnected one-story brick and concrete structures in the northern portion of the site and one free-standing, large, brick structure and one free-standing, large, corrugated metal structure, both in the southern portion of the site. Lot 0005 also contains paved surfaces. The structures were either used for offices, storage or for the repair of city-owned vehicles at the time of the site inspection for the preparation of this report.

The following RECs were noted for Lot 0005:

- **History of Use as a Boat Yard.**
  
  Historical Sanborn Maps indicate Lot 0005 was used as a Boat Yard circa 1911. Boat fueling, maintenance and repair are typically associated with boat yards. The activities typically utilize chemicals such as petroleum, paints (often
containing heavy metals) and solvents. The operational history as a boat yard may have led to on-site soil and or groundwater contamination.

- **History of Auto Repair.**
The Department of Public Works has reportedly used Lot 0005 for vehicle maintenance and repair since circa 1917. These activities typically involve the use of chemicals such as petroleum, paints (often containing heavy metals) and solvents, all of which have been further documented to be currently present on-site during the site inspection for the preparation of this report. The long operational history and as a vehicle maintenance and repair facility may have led to on-site soil and or groundwater contamination.

- **Current and Former Underground and Aboveground Storage Tanks.**
The table below itemizes chemical storage tanks that were observed by ELM personnel during the site inspection or were reported by City of New Rochelle personnel during site interviews. Unless otherwise indicated, the date of installation of these tanks is unknown.

<table>
<thead>

</tbody>
</table>
The following table describes the USTs that were removed from Lot 0005 over the last several years, according to City of New Rochelle personnel during site interviews. This table has been supplemented with information provided in previous studies and other relevant documentation.

<table>
<thead>
<tr>
<th>Tank(s)</th>
<th>Notes</th>
<th>Location</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 x 5,000-gallon diesel and 2 x 2,000-gallon gasoline USTs</td>
<td>These tanks were reportedly removed from the Lot in 1998 and 2001.</td>
<td>A concrete pad was observed between the old large brick structure and the newer corrugated metal garage in the southern portion of the site.</td>
</tr>
<tr>
<td>4 x 1,000-gallon fuel oil USTs</td>
<td>Mr. Fevang indicated these tanks were removed in 1994.</td>
<td>A concrete pad was observed directly east of the newer corrugated metal garage in the southern portion of the site.</td>
</tr>
<tr>
<td>1 x 2,500 gallon waste oil UST.</td>
<td>This tank was reportedly removed in 2003.</td>
<td>An asphalt pad was observed directly south of the newer corrugated metal garage in the southern portion of the site.</td>
</tr>
<tr>
<td>55-gallon Kerosene AST</td>
<td>Mr. Fevang indicated these tanks were removed from the northcentral portion of the site in the late 1990s.</td>
<td>Inside of the corrugated metal garage.</td>
</tr>
</tbody>
</table>

Lot 0005 is listed in the New York State Department of Environmental Conservation (NYS DEC) Petroleum Bulk Storage database for having the following tanks:

- One 3,000-gallon and four 1,000-gallon in-service lube oil underground storage tanks (USTs) that were installed in 1969;

- One 5,000-gallon in-service fuel oil USTs that was installed in 1969;

- One 2,000-gallon in-service fuel oil UST that was installed in 1947;

- One 550-gallon closed fuel oil UST with vaulted access that was installed in 1947 and closed in 1996;

- One 5,000-gallon in-service diesel UST that was installed in 1969; and
Two 2,000-gallon in-service unleaded gasoline USTs that were installed in 1969.

The following tank records were on file for Lot 0005 with the City of New Rochelle Fire Department:

- A record dated December 14, 1961 for the storage of 2,000-gallons of #2 Fuel Oil in an underground storage tank. The tank is noted to be located in the “New Sewers & Drains bldg. Old repair garage. Boiler room on garage at rear of bldg.”

- A record dated December 14, 1961 for the storage of 3,000-gallons of #4 fuel oil in an underground storage tank. A notation on this listing indicated that this tank was removed on April 2002.

- A record dated December 14, 1961 for the storage of 550-gallons of #2 fuel oil in a cellar. The tank is noted to be located in the Adminstration bldg, which front Main Street.

- A record dated March 2, 1970 for the storage of 5,000-gallons of #4 Fuel Oil in an underground storage tank. The tank is noted to be located in the “New Repair Garage.” The tank was reportedly tested in 2004 and again in 2007.

- A record dated November 4, 2004 for the removal of four 1,000-gallon underground motor oil storage tanks. A Petroleum Tank Closure Form also documented the closure of these four tanks. This form noted that the site was not free of contamination after the tank removal.

- An undated Petroleum Tank Closure Form documented the removal of one 4,000-gallon underground storage tank. This form noted that the site was not free of contamination after the tank removal.
• An Installation and/or Modification of Petroleum Bulk Storage Tanks Form dated June 30, 2004 notices the installation of two 4,000-gallon tanks. No information was provided as to whether these tanks were aboveground or underground and no information was provided regarding tank contents.

• A record dated December 11, 2006 references a fuel oil burner connected to a 3,000-gallon aboveground storage tank located in the “Stone Storage bldg. attached to old stone storage garage.”

• A Tightness Test Report dated March 2, 2005 documented the testing of one 5,000-gallon #2 fuel oil underground storage tank. The report documented that the tank was found to be tight.

• A Westchester County Department of Health Petroleum Bulk Storage Registration Certificate issued April 2, 1998 listed the following tanks for Lot 0005:
  - One 3,000-gallon tank associated with Spill No. 9803810 which was removed in April 2002;
  - Four 1,000-gallon tanks;
  - One 5,000-gallon tank; and
  - Three 2,000-gallon tanks that were removed in April 1998. Two of the tanks were noted to be associated with Spill Nos. 9803810 and 9713578.

• A letter dated June 4, 1998 from the City of New Rochelle Department of Public Works to the New York State Department of Environmental Conservation (NYS DEC) regarding Spill No. 9800763 indicated that
an oil water separator would be collected to all floor drains in the garage and to the sanitary sewer system, a 2,000-gallon tank that failed an integrity test has been removed and soil beneath the tank was tested and data was presented to NYS DEC (the letter did not indicate if the soil was contaminated).

- A letter dated March 17, 1998 from ProTest Enterprises to the City of New Rochelle documented the testing of seven tanks located in New Rochelle; three of the tanks were located on Lot 0005. The tanks that were tested that were located on Lot 0005 are as follows:
  
  - One 5,000-gallon diesel underground storage tank;
  - One 5,000-gallon #2 fuel oil underground storage tank;
  - One 2,000-gallon #2 fuel oil underground storage tank (Spill No 9713578 is referenced on the Testing Sheet).

Previous studies further document the site to have historically contained various other ASTs and USTs.

It should be noted that the descriptions of the size, contents and locations of various current and former USTs and ASTs vary in certain reports, PBS listings, City of New Rochelle Fire Department records and information gathered during site interviews and during the site inspection. In many instances, it is difficult to determine which records are duplicative for a tank or a group of tanks.

Nine releases have been reported to NYS DEC Spills Hotline. Two of these reported releases have an active status The City of New Rochelle Department of Public Works is reportedly proceeding under the NYS DEC Spills Group to address the active spill listings.
• **Stored Chemicals.**
  Many chemicals used in auto repair were observed to be present on Lot 0005 during the site inspection for the preparation of this report. These chemicals were stored in 55-gallon drums or smaller containers and were generally located within the corrugated metal garage building. Welding gases and spent automobile batteries were also noted to be present in a portion of the corrugated metal garage building.

  The long history of chemical use may have impacted on-site soil and groundwater.

• **Miscellaneous Fill Material from Unknown Source.**
  Several piles of dirt were observed on the paved portions of the lot during the site inspection. There has been a history of unauthorized dumping on Lot 0005 at various locations. Lot 0005 also has had a history of temporary storage of construction and demolition debris. The long history of unauthorized dumping and storage of construction and demolition debris on Lot 0005 may have impacted subsurface soil and groundwater conditions.

• **On-site Oil-Water Separator.**
  Mr. Fervang noted that an oil/water separator was installed between the old large brick structure and the newer corrugated metal garage in the southern portion of the site. The date of installation of this separator is unknown. Water used in vehicle maintenance in the corrugated metal garage is reportedly collected in metal-grated trenches and directed through this oil water separator before it is discharged to the municipal sewer system. Oil is reportedly removed from the oil/water separator on an as-needed basis.

  The long operation of a waste water collection and oil/water separation system on Lot 0005 may have impacted on-site soil and groundwater conditions..

• **Former On-Site Transformer.**
Previous studies indicated that a transformer was formerly present north of the corrugated metal garage building in the southern portion of the site. This transformer was not observed during the site inspection conducted for the preparation of this report.

Transformers often utilize polychlorinated biphenyls (PCBs). Any releases of PCBs from the former on-site transformer could have impacted soil and/or groundwater conditions.

**Active Spill Listings.**
A total of nine spills were reported to NYS DEC for Lot 0005. Two of the listings remain active. It was reported that some of the seven closed spills were closed by the NYS DEC Project Manager solely for the purpose of consolidated spill listings. A summary of the two open listings follows:

- The New Rochelle Department of Public Works, located on Lot 0005 on the subject property, was listed in the Spills database because a tank test failure occurred on a 2,000-gallon gasoline underground storage tank located in a garage in 1998.

- The New Rochelle Department of Public Works was listed a second time in the Spills database. The active listing reported that someone performing 'site work' identified petroleum-contaminated soil in 2001. The listing indicated that a groundwater investigation was performed in 2002 and a soil vapor extraction/air sparging pilot test occurred in 2004.

**RCRA Generator Listing**
Lot 0005 was listed in the Resource Conservation and Recovery Act Generators database. The listing is summarized below:
The Municipality of New Rochelle, listed at 224 Main Street on Lot 0005 on the subject property, was listed in the RCRA database for having generated 12,135 gallons of solid waste that exhibits the characteristic of ignitability in 1983. There were no violations associated with this listing.

- **Previous and Ongoing Site Remediation.**

Interviews with site personnel and previous studies and other relevant documentation indicate that soil and groundwater investigation and remediation have occurred and continue to occur on Lot 0005.

City of New Rochelle Department of Public Works personnel reported that contaminated soil was discovered in the vicinity of the diesel and gasoline tanks that were removed from between the old large brick structure and the newer corrugated metal garage in the southern portion of the site. Contaminated soil was reportedly removed from this area and six groundwater monitoring wells were installed and sampled. The results of this investigation have not been provided to or reviewed by ELM. City of New Rochelle Department of Public Works personnel further noted that, in 2004, three or four more groundwater monitoring wells were installed in this area as part of a plan to operate an air sparging system to remediate contaminated groundwater. The NYS DEC agreed to delay the operation of the air sparging system until additional soil remediation related to a former sewer pump foundation (see next paragraph) has occurred. Several groundwater monitoring well manhole covers were observed in this area during the site inspection.

Another area of contaminated soil was reportedly discovered when underground piping was installed to link the current gasoline and diesel ASTs to the pump island located directly east of the corrugated metal garage. City of New Rochelle Department of Public Works personnel reported that some contaminated soil was removed from this area and that, during this soil removal, a buried former sewer pump station foundation was identified. The former foundation reportedly acts as
a sink for the collection of contaminated water and oil in the area. Previous studies indicated that 1,400 gallons of product were pumped out of this structure; this report may or may not be related to the RCRA Generator listing from 1983 for the removal of 12,135 gallons of solid waste that exhibits the characteristic of ignitability. The removal of additional water/oil from this area is currently underway under the direction of NYS DEC Spills Group.

**Recommendations for Lot 0005**

Although some soil and groundwater investigation has been performed on Lot 0005, particularly in the southern portion of the site, documentation has not been reviewed to indicate that all recognized environmental conditions have been sufficiently investigated and/or remediated to date. As such, a testing program that includes the sampling of on-site soil and groundwater and sediment from Echo Bay is recommended at this time. This testing program should include the sampling of on-site piles of dirt.

Prior to and/or during redevelopment of site, proper characterization and disposal of stored chemicals, ASTs, USTs and piles of fill material are recommended.

**Lot 0022 - 270 Main Street**

Lot 0022 was historically occupied by residential dwellings and associated out buildings circa 1911 through circa 1931 and by the New Rochelle Armory circa 1931 through the present. The lot currently contains four structures:

- a large, three-story, brick-structure with a basement in the northern portion of the lot;

- a corrugated metal structure in the southern portion of the lot;

- a small, one-story garage structure in the southern portion of the lot; and
o a small storage shed located immediately south of and adjacent to the large, three-story, brick structure with a basement in the northern portion of the site.

In addition, the Lot includes paved and landscaped surfaces. The one-story garage and the storage shed were inaccessible at the time of the site inspection for the preparation of this report, but reportedly contain stored building materials. The large three-story brick structure is reportedly vacant most of the time, with the exception of around Halloween, when it is used by the City of New Rochelle as a Haunted House. The corrugated metal structure is currently being used by Habitat for Humanity for buildings materials storage. Habitat for Humanity also stores building materials in metal containers and in piles on the paved and landscaped portions of the lot.

The following RECs were noted for Lot 0022:

- **Current and Former Underground and Aboveground Storage Tanks.**

  Two 275-gallon ASTs, two old boilers, wall-mounted electrical units and a water tank were observed in a boiler room located in the basement of the large three-story brick building. A previous study indicated that cracks were observed in the boiler room and a fuel oil odor was also observed.

  Lot 0022 was listed twice in the NYS DEC Petroleum Bulk Storage database. A summary of these listings is below:

  - New Rochelle Armory, listed at 270 East Main Street on Lot 0022 on the subject property, was listed in the PBS database as having one 8,000-gallon in-service fuel oil UST with vaulted access.

  - Navy Motion Picture Service, listed at 270 Main Street on Lot 0022 on the subject property, was listed in the PBS database as having one 7,500-gallon in-service fuel oil UST with vaulted access.
A vent pipe and fill cap, presumably associated with either the ASTs in the boiler room or the USTs noted in the PBS listing, were observed outside of the southern side of the large three-story brick structure during the site inspection.

The City of New Rochelle reported that one fuel oil tank is currently active on Lot 0022, though it is unclear which of the identified tanks is the active tank.

Any historical releases of petroleum or other chemicals from ASTs or USTs may have impacted on-site soil and groundwater.

• **Former on-site Shooting Range**

A former shooting range associated with the Armory use was observed in the basement of the three-story building. It is unknown when and for how long the shooting range was utilized. The floor of the range was concrete and no bullets or spent shot were observed in the room at the time of the site inspection.

Lead associated with ammunition for guns discharged on the shooting range may have impacted on-site soil and/or groundwater conditions if cracks were present in the basement concrete or if the floor of the shooting range was historically dirt.

• **Stored Chemicals.**

One half-full 55-gallon drum was observed in the basement of the three-story building; the contents of this drum were unknown. One 20-cubic yard waste container was noted to be present on the paved and landscaped areas. It was filled with miscellaneous building materials. A stack of paint cans and containers of <5-gallon capacity were noted to be stored in a landscaped area in the southern portion of the site.

The long period of military operations at the site may have resulted in historical releases of petroleum or other chemicals that impacted on-site soil and groundwater.
• **Three RCRA Generator Listings**

Lot 0022 was listed three times in the Resource Conservation and Recovery Act Generators database. The listings are summarized below:

  o NYS DEC Region 3, listed at 270 Main Street on Lot 0022 on the subject property, was listed in the RCRA database for having generated 200 pounds of mercury in 2000.

  o Naval Motion Picture Service, listed at 270 Main Street on Lot 0022 on the subject property, was listed in the RCRA database as a Conditionally-Exempt Small Quantity Generator for having generated 55 gallons of lead in 1994.

  o US Navy Motion Picture Service, listed at 270 Main Street on Lot 0022 on the subject property, was listed in the RCRA database as a Conditionally-Exempt Small Quantity Generator. No information related to the type or volume of wastes generated was provided in the listing.

The undocumented mishandling of any chemicals on Lot 0022 may have impacted on-site soil and/or groundwater conditions.

• **Chemical Staining**

Previous studies reported that areas of “chemical staining” were observed in the vicinity of an on-site garage building during a site inspection of Lot 0022 on March 28, 2003. Although no evidence of staining was noted during the site inspection for the preparation of this report, the previous report observations indicate the potential for a chemical release to have occurred that may have adversely impacted on-site soil and groundwater quality.

*Recommendations for Lot 0022*
A testing program that includes the sampling of on-site soil and groundwater and sediment from Echo Bay is recommended to further investigate the recognized environmental conditions for Lot 0022.

Prior to and/or during redevelopment of site, proper characterization and disposal of stored chemicals, ASTs and USTs is recommended.

**Lot 0110 - Huntington Place**

Lot 0110 was historically the location of a boat house and hen house (circa 1911), vacant land (circa 1931 through 1951) and a boat yard and motor house (circa 1990). Lot 0110 is currently improved with two one-story vacant structures (one small, one-story, brick and concrete structure in the northern portion of the site and one larger, one-story corrugated metal structure in the western portion of the site), a bulkhead fronting Echo bay and paved and landscaped surfaces. Lot 0110 is currently vacant and fenced.

The following RECs were identified for Lot 0110:

- **History of Use as a Boat Yard.**
  
  Historical Sanborn Maps and previous studies indicate Lot 0110 was used as a boat yard and as a marina. Boat fueling, maintenance and repair are typically associated with boat yards and marinas. The activities typically utilize chemicals such as petroleum, paints, and solvents. The operational history and potential handling of chemicals typically associated with boat yards may have lead to on-site soil, groundwater and/or sediment contamination.

- **Current Aboveground Storage Tanks.**
  
  One 275-gallon AST was observed inside of the large one-story corrugated metal structure. The contents of the tank were unknown.
Historical releases of petroleum or other chemicals from ASTs may have impacted on-site soil and groundwater.

- **Miscellaneous Drums.**
  A metal container box was observed on the landscaped portion of the lot. One 55-gallon drum was observed within the metal container box; the contents of this drum were unknown.

  Chemical use on Lot 0110 may have resulted in historical releases of petroleum or other chemicals that impacted on-site soil and groundwater. Similarly, if these chemicals are mishandled in the future, on-site soil and groundwater could be impacted.

- **Miscellaneous Fill Material from Unknown Source.**
  Several piles of dirt were observed on the landscaped and paved portions of the lot. There has been a history of unauthorized dumping on Lot 0110 at various locations. Lot 0110 also has had a history of temporary storage of construction and demolition debris. The long history of unauthorized dumping and storage of construction and demolition debris on Lot 0110 may have impacted subsurface soil and groundwater conditions.

**Recommendations for Lot 0110**
A testing program that includes the sampling of on-site soil and groundwater and sediment from Echo Bay is recommended to further investigate and characterize all recognized environmental conditions for Lot 0110. This testing program should include the sampling of on-site piles of dirt.

Prior to and/or during redevelopment of site, proper characterization and disposal of on-site drums, storage tanks and piles of dirt are recommended.

The following RECs were identified for all three lots that comprise the subject property:
Historic Fill from Unknown Sources

Historical topographic maps, historical aerial photographs, a previous study (Draft Brownfields Site Background Memorandum for New Rochelle City Armory, 270 Main Street, New Rochelle, New York, prepared by Foster Wheeler Environmental Corporation and dated March 2003) and a Geotechnical Report (Draft Preliminary Geotechnical Report, Echo Bay Project, New Rochelle, New York, prepared by Mueser Rutledge Consulting Engineers and dated April 3, 2007) document the use of fill material from an unknown origin to extend the Echo Bay shoreline along the southern portion of Lots 0005, 0022 and 0110.

Because this fill material is of unknown origin, it is recommended that a subsurface testing program be implemented to determine whether any contaminant sources are present in the fill material.

Fluorescent Lights

Lots 0005, 0022 and 0110 contain buildings that utilize fluorescent lighting. Older fluorescent lights and fixtures may include polychlorinated biphenyl (PCB)- and/or mercury-containing components (including capacitors and potting compounds). Any releases of PCBs or mercury from the fluorescent lighting could have impacted soil and/or groundwater conditions.

Fluorescent lights and fixtures should be properly disposed of during demolition of any existing structures on these Lots.

Suspect Asbestos-containing Building Materials and Lead-Based Paint

Lots 0005, 0022 and 0110 contain buildings that may contain asbestos-containing building materials (ACBM) and/or lead-based paint (LBP).
Prior to any renovation or demolition activities with the potential to disturb suspect ACBMs, an asbestos survey should be conducted. If these materials prove to contain asbestos, they should be properly removed and disposed of in accordance with all state and federal regulations. If any of the aforementioned ACMs are to be unaffected by any future renovation activities, they can remain in the buildings and will need to be managed in accordance with applicable federal regulations (29 CFR 1910.1001) of the Occupational Health and Safety Administration (OSHA). These OSHA regulations include requirements for the training of building occupants and workers, posting of warning signs and labeling of the ACMs, appropriate maintenance procedures to avoid disturbances of ACMs, and record keeping, etc. ACMs should be regularly inspected and maintained by licensed contractors to prevent deterioration.

Any renovation or demolition activities with the potential to disturb lead-based paint must be performed in accordance with the applicable Occupational Safety and Health Administration regulation (OSHA 29 CFR 1926.62 - Lead Exposure in Construction). Current New York State Department of Environmental Conservation guidance permits the disposal of construction materials covered with lead-based paint as demolition debris within an approved landfill.

**Off-site History of Industrial Use**

Commercial and industrial uses were shown to be interspersed with residential uses in the area surrounding the subject property in historical Sanborn maps from 1911 through 1990. Commercial and industrial uses in the surrounding area included: a lunch wagon factory (circa 1911), a manufacturer of dining cars (circa 1931), a supplier of coal and building materials (circa 1931), oil storage terminal(s) (circa 1931 through 1990), a chemical laboratory (circa 1951 through circa 1990), a furniture warehouse (circa 1951), an upholsterer (circa 1951), Power Tronic Systems Electronics (circa 1990), an electronics laboratory (circa 1990) and auto repair facilities, auto parking, auto sales, auto painting and filling stations (various years).

LIMITED WARRANTY AND DISCLAIMER OF LIABILITY

Who is Covered

This limited warranty is extended by Toxics Targeting, Inc. only to the original purchaser of the accompanying Environmental Report ("Report"). It may not be assigned to any other person.

What is Warranted

Toxics Targeting, Inc. warrants that it uses reasonable care to accurately transcribe the information contained in this Report from the sources from which it is obtained. This limited warranty is in lieu of all other express warranties which might otherwise arise with respect to the Report. No one is authorized to change or add to this limited warranty.

What We Will Do

If during the warranty period there is shown to be a material error in the transcription of the information contained in this Report from the sources from which it was obtained, Toxics Targeting, Inc. shall refund to the original purchaser the full purchase price paid for the Report. The remedy stated above is the exclusive remedy extended to the Purchaser by Toxics Targeting, Inc. for any failure of the Report to conform with this Warranty, or otherwise for breach of this Warranty or any other warranty, whether expressed or implied.

What We Won’t Cover

Toxics Targeting, Inc. has not and cannot verify the accuracy, correctness or completion of the information contained in this Report. Information is obtained from government agencies, site owners, and other sources, and errors are common in such information. Because Toxics Targeting, Inc. can not control the accuracy of the information contained in this Report, or the uses which may be made of the information, TOXICS TARGETING, INC. DISCLAIMS LIABILITY TO ANYONE FOR ANY EVENTS ARISING OUT OF THE USE OF THE INFORMATION. TOXICS TARGETING, INC. SHALL NOT BE LIABLE FOR ANY DAMAGE CAUSED BY THIS REPORT, WHETHER DIRECT OR INDIRECT, AND WHETHER OR NOT TOXICS TARGETING, INC. HAS BEEN ADVISED OF OR HAS KNOWLEDGE OF THE POSSIBILITY OF SUCH DAMAGES. TOXICS TARGETING, INC. EXPRESSLY DISCLAIMS ANY AND ALL IMPLIED WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR USE. Some jurisdictions do not allow the exclusion or limitation of incidental or consequential damages, so the above exclusion or limitation may not apply to you.

Period of Warranty

The period of warranty coverage is ninety days from the date of purchase of this Report. There shall be no warranty after the period of coverage. ANY AND ALL IMPLIED WARRANTIES OF MERCHANTABILITY OR FITNESS FOR PARTICULAR USE SHALL HAVE NO GREATER DURATION THAN THE PERIOD OF WARRANTY STATED HERE, AND SHALL TERMINATE AUTOMATICALLY UPON THE EXPIRATION OF SUCH PERIOD. Some jurisdictions do not allow limitations on how long an implied warranty lasts, so the above exclusion or limitation may not apply to you.

PLEASE REFER TO PAGES ONE AND FOUR FOR A DESCRIPTION OF SOME OF THE LIMITATIONS OF THIS ENVIRONMENTAL REPORT.

© Toxics Targeting, Inc. 2007
Introduction

Toxics Targeting has combined environmental database searches, extensive regulatory analysis and sophisticated mapping techniques to produce your Environmental Report. It checks for the presence of 21 categories of government-reported toxic sites and provides detailed, up-to-date information on each identified site. The findings of your report are presented in an easy-to-understand format that:

1. **Maps** the approximate locations of selected government-reported toxic sites identified on or near a specified target address.

2. **Estimates** the distance and direction between the target address and each identified toxic site.

3. **Reports** air and water permit non-compliance and other regulatory violations.

4. **Profiles** some aspects of the usage, manufacture, storage, handling, transport or disposal of toxic chemicals at individual sites.

5. **Summarizes** some potential health effect information and drinking water standards for selected chemicals reported at individual sites.

The Three Sections Of Your Report

The first section highlights your report’s findings by summarizing identified sites according to: a) distance intervals, b) direction, c) proximity to the target address and d) individual site categories. In addition, the locations of all identified toxic sites are illustrated on individual maps for each radius search distance used in your report. A close-up map illustrates the locations of all identified toxic sites, at the shortest radius search distance used in your report. Finally, a map of tax parcels and a table of selected information about those parcels are included.

The second section of your report contains Toxic Site Profiles that provide detailed information on each identified toxic site. The information in each Toxic Site Profile varies according to its source. Some toxic site categories have extensive information, some have limited information. All the information is updated on a regular basis.

The third section of the report contains appendices that identify: 1) on-site spills reported to the national Emergency Response Notification System (ERNS), 2) various toxic sites that cannot be mapped due to incomplete or erroneous addresses or other mapping problems, 3) codes that characterize hazardous wastes reported at various facilities, 4) methods used to map toxic sites identified in your report and 5) information sources used in your report.

How to Use Your Report

- Check Table One to see the number of identified sites by distance intervals.
- Check Table Two to see identified sites sorted by direction.
- Check Table Three to see identified sites ranked by proximity to the target address.
- Check Table Four to see identified sites sorted by site categories.
- Use Table Five to get info for the subject parcel and every parcel found on the Tax Parcel Map
- Refer to the various maps to see the locations of identified toxic sites. Refer to the Toxic Site Profile and Appendix sections for additional information.
Toxic Site Databases Analyzed In Your Report

Search Radius

One-Mile

1) National Priority List for Federal Superfund Cleanup: a listing of sites known to pose environmental or health hazards that are being investigated or cleaned up under the Federal Superfund program.

Half-Mile

2) Delisted National Priority List Sites: a listing of NPL sites that have been removed from the National Priority List.

One-Mile

3) New York Inactive Hazardous Waste Disposal Site Registry: a state listing of sites that can pose environmental or public health hazards requiring investigation or clean up.

One-Mile

One-Mile

5) RCRA Corrective Action Activity (CORRACTS): waste facilities with RCRA corrective action activity reported by the USEPA.

Half-Mile

6) CERCLIS (Comprehensive Environmental Response, Compensation and Liability Information System): a federal listing of Non-NFRAP sites that can pose environmental or public health hazards requiring investigation or clean up.

Half-Mile

7) CERCLIS NFRAP: a federal listing of CERCLIS sites that have no further remedial action planned.

Half-Mile

8) New York State Brownfield Cleanup Sites: a listing of sites that are abandoned, idled or under-used industrial and commercial sites where expansion or redevelopment is complicated by real or perceived environmental contamination.

Half-Mile

9) New York Solid Waste Facilities Registry: active and inactive landfills, incinerators, transfer stations or other solid waste management facilities.

Half-Mile

10) New York and Federal Hazardous Waste Treatment, Storage or Disposal Facilities: sites reported by the NYS manifest system and the USEPA’s Resource Conservation and Recovery Act Information System (RCRIS). Also includes the following database:

   - RCRA violations: waste facilities with violations reported by the USEPA pursuant to the Resource Conservation and Recovery Act.
11) **Toxic Spills: active and inactive or closed** spills reported to state environmental authorities, including remediated and unremediated leaking underground storage tanks. This database includes the following categories:

- Tank Failures
- Tank Test Failures
- Unknown Spill Cause or Other Spill Causes
- Miscellaneous Spill Causes

12) **New York State Major Oil Storage Facilities**: sites with more than a 400,000-gallon capacity for storing petroleum products.

13) **New York and Local Petroleum Bulk Storage Facilities**: sites with more than a 1,100-gallon capacity for storing petroleum products.

14) **New York and Federal Hazardous Waste Generators and Transporters**: sites reported by the NYS manifest system and the USEPA’s Resource Conservation and Recovery Act Information System (RCRA). Also includes the following database:

- **RCRA violations**: waste facilities with violations reported by the USEPA pursuant to the Resource Conservation and Recovery Act.

15) **New York Chemical Bulk Storage Facilities**: sites storing hazardous substances listed in 6 NYCRR Part 597 in aboveground tanks with capacities of 185 gallons or more and/or underground tanks of any size.

16) **New York Hazardous Substance Disposal Site Draft Study**: a state listing of sites contaminated with toxic substances that can pose environmental or public health hazards. These sites are not eligible for state clean up funding programs.

17) **Federal Toxic Release Inventory Facilities**: discharges of selected toxic chemicals to air, land, water or treatment facilities.

18) **Federal Air Discharges**: Air pollution point sources monitored by U.S. EPA and/or state and local air regulatory agencies.

19) **Federal Permit Compliance System Toxic Wastewater Discharges**: permitted toxic wastewater discharges.

20) **Federal Civil and Administrative Enforcement Docket**: judiciary cases filed on behalf of the U. S. Environmental Protection Agency by the Department of Justice.
21) **ERNS: Federal Emergency Response Notification System Spills**: a listing of federally reported spills.
Limitations Of The Information In Your Report

The information presented in your Environmental Report has been obtained from various local, state and federal government agencies. Please be aware that: 1) additional information on individual sites may be available, 2) newly discovered sites are continually reported and 3) all map locations are approximate. As a result, this report is intended to be the FIRST STEP in the process of identifying and evaluating possible environmental threats to specific properties and can only serve as a guide for conducting on-site visits or additional, more detailed toxic hazard research.

Toxics Targeting tries to ensure that the information in your report is presented accurately and with minimal alteration. The only systematic changes that are made correct obvious address errors in order to allow sites to be mapped. Any address changes that are made are noted in the map information section at the top of each corresponding Toxic Site Profile. Since the information presented in your report is not edited, please be aware that it can contain reporting errors or typographical mistakes made by the site owners/operators or government agencies that produced the information. Please be aware of some other limitations of the information in your report:

- The map used by Toxics Targeting is the same one used by the U. S. Census. While the map is generally accurate, no map is perfect. In addition, Toxics Targeting’s mapping methods estimate where toxic site addresses are located if the address is not specifically designated on the Census map. FOR THESE REASONS, ALL MAP LOCATIONS OF ADDRESSES AND REPORTED TOXIC SITES SHOULD BE CONSIDERED APPROXIMATE AND SHOULD BE VERIFIED BY ON-SITE VISITS;

- UNDISCOVERED, UNREPORTED OR UNMAPPABLE TOXIC SITES MIGHT NOT BE IDENTIFIED BY THIS REPORT’S CHECK OF 21 TOXIC SITE CATEGORIES. TOXIC SITES REPORTED IN OTHER GOVERNMENT DATABASES MIGHT ALSO EXIST. FOR THESE REASONS, YOUR REPORT MIGHT NOT IDENTIFY ALL THE TOXIC SITES THAT EXIST IN THE AREA IT SEARCHES;

- The appendix of your report contains a listing of sites that could not be mapped due to incomplete or erroneous address information or other mapping problems. This listing includes unmappable toxic sites in zip code areas within one mile of the target address as well as toxic sites without zip codes reported in the same county. IF YOU WOULD LIKE INFORMATION ON ANY OF THE LISTED SITES, PLEASE CONTACT TOXICS TARGETING AND REFER TO THE SITE ID NUMBER.

- Some toxic sites identified in your report may be classified as known hazards. Most of the toxic sites identified in your report involve potential hazards related to the on-site use, manufacture, handling, storage, transport or disposal of toxic chemicals. Some of the toxic sites identified in your report may be the addresses of parties responsible for toxic sites located elsewhere. YOU SHOULD ONLY CONCLUDE THAT TOXIC HAZARDS ACTUALLY EXIST AT A SPECIFIC SITE WHEN GOVERNMENT AUTHORITIES MAKE THAT DETERMINATION OR WHEN THAT CONCLUSION IS FULLY DOCUMENTED BY THE FINDINGS OF AN APPROPRIATE SITE INVESTIGATION UNDERTAKEN BY LICENSED PROFESSIONALS;

- Compass directions and distances are approximate. Compass directions are calculated from the subject property address to the mapped location of each identified toxic site. The compass direction does not necessarily refer to the closest property boundary of an identified toxic site. The compass direction also can vary substantially for toxic sites that are located very close to the subject property address.

- The information presented in your report is a summary of the information that Toxics Targeting obtains from government agencies on reported toxic sites. YOU MAY BE ABLE TO OBTAIN ADDITIONAL INFORMATION ABOUT REPORTED SITES WITH THE FREEDOM OF INFORMATION REQUEST FORM LETTERS THAT ARE PROVIDED ON THE INSIDE OF THE BACK COVER.
Section One:

Section Two: Toxic Site Profiles

The heading of each Toxic Site Profile refers to the site's map location and details:

- The facility name, address, city, state, and zip code (This information does not appear in the headings for Inactive Hazardous Waste Disposal Sites).
- Any changes that were made to a site's address in order to map its location.
- The site mapping method that was used (see How Sites are Located, at the end of this section for more information).

Toxic Site Profiles summarize information provided by site owners or operators and government agencies regarding various toxic chemical activities reported at each site, such as:

- Whether chemicals were stored, produced, transported, discharged or disposed of.
- The name of chemicals and their Chemical Abstract Series (CAS) numbers;
- The amount of chemicals and the units (gallons/pounds) the chemical was measured in.
- Whether the site or storage tanks at the site are currently active or inactive.
- Special codes used by government agencies to regulate hazardous waste activities at some sites

(A complete description of the codes follows the profiles section).

For selected individual chemicals reported at various toxic sites, some potential health effect summary information appears below the site profile. Each potential health effect summary identifies chemicals by name and by Chemical Abstract Series (CAS) Number. An "x" under each potential health effect heading indicates positive toxicity testing results reported by the National Institute of Occupational Safety and Health's Registry of Toxic Effects of Chemical Substances (RTECS). Some chemicals (mostly appearing in profiles of Hazardous Waste facilities), are reported as mixtures, and RTECS health effect information is only available for individual chemicals. In addition, RTECS only provides information on approximately 100,000 common chemicals. Consequently, the absence of potential health effect summary information for a particular chemical identified in a Toxic Site Profile does not necessarily mean that the chemical does not pose potential health effects.

The Maximum Contaminant Level (MCL) in drinking water allowed for selected chemicals is also noted. In most cases, the only applicable MCL has been set by the New York State Department of Health (NYSDOH). Where NYSDOH has not set an MCL, the federal standard, if one exists, is listed and is marked by an asterisk.

Presented below are column headings that describe the health effect definitions used in RTECS and applicable New York State and federal drinking water standards. Reference sources for information presented in this section are also provided.

ACUTE TOX:  **Acute Toxicity**: Short-term exposure to this chemical can cause lethal and non-lethal toxicity effects not included in the following four categories.

TUMOR TOX:  **Tumorigenic Toxicity**: The chemical can cause an increase in the incidence of tumors.

MUTAG TOX:  **Mutagenic Toxicity**: The chemical can cause genetic alterations that are passed from one generation to the next.
**REPRO TOX:**  Reproductive toxicity: May signify one of the following effects: maternal effects, paternal effects, effects on fertility, effects on the embryo or fetus, specific developmental abnormalities, tumorigenic effects, or effects on the newborn (only positive reproductive effects data for mammalian species are referenced)

**IRRIT TOX:**  Primary Irritant: The chemical can cause eye or skin irritation

**MCL:**  Drinking Water Standard - Maximum Contaminant Level (MCL) listed under Drinking Water Supplies, 10 NYCRR Part 5, Subparts 1.51(f),(g), and (h) for NYDOH MCL's and under the Safe Drinking Water Act, 40 CFR 141, Subparts B and G, (* indicates value for total trihalomethanes) for federal MCL's.

Reference Source for Toxicity Information: Registry of Toxic Effects of Chemical Substances (RTECS), NIOSH (on-line database); For further information, contact: NIOSH, 4676 Columbia Parkway, Cincinnati, OH, 45226, 800/35-NIOSH.

Inactive Hazardous Waste Disposal Site Classifications:  1 -- Causing or presenting an imminent danger of causing irreversible or irreparable damage to the public health or the environment -- immediate action required;

2 -- Significant threat to the public health or environment -- action required;

3 -- Does not Present a significant threat to the environment or public health -- action may be deferred;

4 -- Site properly closed --requires continued management;

5 -- Site properly closed, no evidence of present or potential adverse impact -- no further action required;

2a -- This temporary classification has been assigned to sites where there is inadequate data to assign them to the five classifications specified by law.

D1, 2, 3 -- Delisted Site (1: hazardous waste not found; 2: remediated; 3: consolidated site or site incorrectly listed)
* NO NATIONAL PRIORITIES LIST (NPL) SITES IDENTIFIED WITHIN 1 MILE SEARCH RADIUS *
* INACTIVE HAZ WASTE DISPOSAL REGISTRY OR REGISTRY-QUALIFYING SITES IDENTIFIED WITHIN 1 MILE SEARCH RADIUS *

ADDRESS..:  4 Irving Place, New York, NY 10003
NAME......:  CONSOLIDATED EDISON OF NEW YORK, INC
ADDRESS..:  4 IRVING PLACE, NEW YORK, NY 10003
HAZARDOUS WASTE DISPOSAL PERIOD: from unknown to 1981

SITE DESCRIPTION:
The site, approximately 150 feet x 600 feet in size, was originally owned by Westchester Lighting Co. and subsequently was acquired by Consolidated Edison in the early 1930's. Con Ed operated an electrical distribution substation at this site until 1981, when the substation was closed. The site is bounded by a fuel oil dealer, a tidal creek, Echo Bay (Long Island Sound), and private residences. The site includes substation buildings and a transformer yard. PCBs have been found in soils and catch basin sediments, and on surfaces within structures. Con Ed has completed initial clean-up. Subsequent sampling showed PCB levels as high as 50 ppm remaining. A Preliminary Site Assessment (PSA) was conducted pursuant to a consent order. The results showed areas of site soils to be contaminated with PCBs above the cleanup goals of 1 ppm. These soils were removed from the site. Additional sampling of both on-site and off-site soils and sediment were conducted between 1995 & 1998. One sample showed high levels of PCBs in soils greater than 1900 ppm. Echo Bay sediments showed one area at 220 ppm. All site buildings and structures were removed in August of 1995. As of February 1998, 600 tons of PCB contaminated soil was removed from on and off site, including four residential yards. Removal of on-site concrete slabs and soil sampling of those soils under each slab has been completed and small quantities of PCB contaminated soils and sediments in unmapped buried trenches were removed. Backfilling with clean soil in parts of the site was completed. One final area of the site will be be excavated and backfilled with clean soil in 2002. An exposure assessment and a fish and wildlife impact analysis for the off-site mudflat area are in progress.

CONFIRMED HAZARDOUS WASTE DISPOSED:

<table>
<thead>
<tr>
<th>TYPE</th>
<th>QUANTITY</th>
</tr>
</thead>
<tbody>
<tr>
<td>PCBs (B007)</td>
<td>UNKNOWN</td>
</tr>
</tbody>
</table>

ASSESSMENT OF ENVIRONMENTAL PROBLEMS:
On site soil and sediment contain PCBs. Echo Bay sediments contain significant levels of PCB. The back yards of private residences were found to be contaminated with PCBs at levels from 1.1 to 5.6 ppm.

ASSESSMENT OF HEALTH PROBLEMS:
The site is immediately adjacent to residential and commercial properties and extends to the Echo Bay tidal lands. Access to the site is restricted by chain-link fencing. PCBs had been found at elevated levels in the former substation building and surrounding soil. On-site cleanup of PCBs is nearing completion and the majority of the site has been covered with clean fill. Final remedial activities including off-site sediment removal in an adjacent mud-flat area should be completed in 2003. Soil sampling conducted at adjacent residential properties found PCBs in four yards above the cleanup guideline of 1 part per million. The PCB contaminated soils in the yards were excavated and removed. There are no known drinking water supply wells in the vicinity.

The New York State Department of Environmental Conservation has not publicly updated the following fields since 2003:

SITE DESCRIPTION:
The Cedar Street Former MGP (Con Edison) operated between circa 1863-68 and 1931. The site is located on Cedar Street, between Spring Street and Ramada (Sheraton) Plaza in the City of New Rochelle, Westchester County. The site is currently occupied by a car dealership.

A site characterization work plan was approved in December 2005. Field work is anticipated in 2006. (03/06)

CONFIRMED HAZARDOUS WASTE DISPOSED:
None reported

ASSESSMENT OF ENVIRONMENTAL PROBLEMS:
The site is a former MGP site that is an active car dealership. A Site Characterization is scheduled for 2006. (03/06)

ASSESSMENT OF HEALTH PROBLEMS:
DOH has insufficient information to evaluate the potential for human exposures.

OWNER(S) DURING DISPOSAL:

OPERATOR(S) DURING DISPOSAL:
  NAME: TAE YOON KIM
  ADDRESS: 55 LOCUST AVENUE
  NEW ROCHELLE, NY 10801

SITE DESCRIPTION:
Location Description: The site is located in an urban area of Westchester County, at the southeastern corner of the intersection of Clinton Place and North Avenue in the City of New Rochelle.

Site Features: The site is covered by a 5,280 square foot, one story brick commercial building with a full basement. The building is divided into four tenant spaces which include a bar/lounge, beauty salon, a vacant space and a dry-cleaning business.

Surrounding uses: Include parking lots, businesses, offices, residential buildings, and a medical center.

Historical Sources of Contamination: The prior use leading to site contamination was the operation of a dry-cleaning business, and disposal or leaks of perchloroethylene (PCE), a solvent used in the operation.

Investigations/actions performed to date: Completed investigations include a Phase I Investigation carried out in October of 2003 and a Phase II Investigation completed in March of 2004.

Current Actions: Investigation Work began in March 2006

CONFIRMED HAZARDOUS WASTE DISPOSED:
None reported

ASSESSMENT OF ENVIRONMENTAL PROBLEMS:
The primary contaminant of concern at the site is perchloroethylene (PCE). In addition to PCE, sampling completed as part of the Phase II investigation indicates a number of chlorinated solvents and other volatile organic compounds in soil and in groundwater at concentrations which exceed applicable levels of concern. Based on the type and concentration of contaminants in soil and groundwater, it is likely that further investigation will confirm contamination in soil gas and indoor air as well.
ASSESSMENT OF HEALTH PROBLEMS:
On-site groundwater and soil vapor is contaminated with volatile organic compounds. The area is served with public water therefore, ingestion exposure is not a potential exposure pathway. Indoor air sampling conducted on-site indicated that VOCs, mainly tetrachloroethene is present above the NYSDOH guideline of 100 micrograms per cubic meter. Therefore, inhalation is a documented exposure pathway at this site.

CLASSIFICATION CODE DESCRIPTION: No description provided

NAME OF SITE: Schmucker's Dry Cleaners
STREET ADDRESS: 358-364 North Avenue
CITY: New Rochelle
SITE TYPE: Dump- Structure- Lagoon- Landfill- Treatment Pond-
INSTITUTIONAL/ENGINEERING CONTROLS: None reported
CROSS REFERENCES: None reported

SITE OWNER/OPERATOR INFORMATION:
CURRENT OWNER(S):
NAME: HNJ REALTY, LLC
HAL SHAPIRO
ADDRESS: 303 E. 57TH STREET #10J
NEW YORK, NY 10022

SITE DESCRIPTION:
The site is a multi-tenant commercial building with an address of 358-364 North Avenue in New Rochelle, Westchester County. The site is identified as Tax Parcel 19, block 1206, section 4, zoned for downtown business in zone district C-2. The site has a total area of 0.21 acres, most of which is covered by the brick row building built in 1914 for office and retail space. This building was redeveloped from two residential buildings built in 1891. The immediate area is generally commercial with residential housing on adjacent properties to the west and south. The site includes an enclosed backyard area to the immediate west of the building which includes grassy areas, a paved walkway, and elevated planters.

The first floor and basement of the site building has been utilized by Schmuckler’s Dry Cleaners since circa 1914. An addition was made to the western portion of the building circa 1937, to the southwestern portion prior to 1987, and to the northwestern portion of the building in 1987. A portion of the building is currently rented to All Sports Althletic Wear which is also located on the first floor. Various small offices occupy the second floor of the site building.

The dry cleaning operations resulted in soil contamination of tetrachloroethene (PCE) and other chlorinated solvents.

The site was acquired by the BCP applicant, HNJ Realty, LLC, in August 2005. In December, HNJ applied to enter the BCP program. The application is deemed complete. A BCP agreement is being negotiated. (03/06)

CONFIRMED HAZARDOUS WASTE DISPOSED:
None reported

ASSessment of Environmental Problems:
Information submitted with the BCP application indicate dry cleaning chemicals in subsurface soils behind the dry cleaner. Level of PERK is soil exceed SCGs. No groundwater or soil vapor data has been collected. Additional investigation is required. (03/06)

Assessment of Health Problems:
Information submitted with the BCP application regarding the conditions at the site are currently under review and will be revised as additional information becomes available.

HAZARDOUS MATERIAL SPILLS INTRODUCTION

The Hazardous Material Spills in this section are divided into eight spill cause groupings. These include:

Active Spills Section: Spills with incomplete paperwork that may or may not be cleaned up (See Date Cleanup Ceased)
   1) Tank Failures
   2) Tank Test Failures
   3) Unknown Spill Cause or Other Spill Cause Hazardous Spills

Closed Status Spills Section: Spills with completed paperwork that may or may not be cleaned up (See Date Cleanup Ceased)
   5) Tank Failures
   6) Tank Test Failures
   7) Unknown Spill Cause or Other Spill Cause Hazardous Spills

All spills within each spill cause category are presented in order of proximity to the subject site address.

Please note that spills reported within 0.25 mile (or one-eighth mile in Manhattan) are mapped and profiled.

Between 0.25 mile (or one-eighth mile in Manhattan) and 0.5 mile, only the following spills are mapped and profiled:

* Tank Failures;
* Tank Test Failures;
* Unknown Spill Cause or Other Spill Cause;
* Spills greater than 100 units of quantity; and
* Spills reported in the NYSDEC Fall 1998 MTBE Survey.

A table at the end of each section presents a listing of reported Miscellaneous Spills with less than 100 units located between 0.25 mile (or one-eighth mile in Manhattan) and 0.5 mile. These spills are neither mapped nor profiled.

**Caller Remarks:**
Tank failure at above location. Per property owner Miller environmental is responding.

**DEC Investigator Remarks:**

10/17/03: Letter to H&B Petroleum Corp. from Karen Magnuson, WCDOH dated 10/6/2003. WCDOH requested site assessment be performed to determine cause of spill and extent of contamination. This report has not been received as of this date. Report is due to WCDOH by 10/29/2003.

12/2/03: Letter to H&B Petroleum Corp; A&B Auto Repair Corp. Wells are contaminated and not acceptable as leak detection. Alternate form of leak detection must be installed or tanks must be removed. Site assessment to determine cause of spill and extent of contamination must be done with results submitted to WCDOH by 14 Jan 2004.

assessment report by Royal Environmental Services dated 13Apr04 has been reviewed. Due to petroleum contamination present on site, WCDOH requires further remediation. Report detailing pumping out of MW and completion of WCDOH requirements must be submitted by 24May2004.

9/28/05 Also see spills 03-11827, 05-07653 and 05-07677. jod

**Callers Remarks:**
CLEAN UP IS NOT IN PROCESS AND THERE IS A DISPUTE ABOUT HOW MUCH OIL WAS DELIVERED INTO THE TANK. THEY CANT FIND THE OIL SO THEY MAY THINK THAT THERE WASNT EVEN A SPILL.
DEC Investigator Remarks:
03/16/06: No evidence of a spill as of yet. Occurred during an oil delivery. Driver stuck tank and filled from a curb line. When sticking after, tank only received 340 gal., but truck meter shows 450 gal pumped. Truck meter was checked and is correct. They think starting stick reading may have been incorrect. Site will be investigated.

**DEC Investigator Remarks:** NO DEC INVESTIGATOR REMARKS GIVEN FOR THIS SPILL.
CLOSED STATUS HAZARDOUS SPILLS - MISC. SPILL CAUSES - EQUIPMENT FAILURE, HUMAN ERROR, TANK OVERFILL, DELIBERATE SPILL, TRAFFIC ACCIDENT, HOUSEKEEPING, ABANDONED DRUM, AND VANDALISM - IDENTIFIED WITHIN 1/2 MILE SEARCH RADIUS.

All spills mapped and profiled within 1/4 mile. Between 1/4 mile and 1/2 mile search radius, spills reported to be greater than 100 units and spills reported in the NYSDEC Fall 1998 MTBE Survey are mapped and profiled. Spills reported to be less than 100 units are listed in a table at the end of this section.

Please Note: * - Compass directions can vary substantially for sites located very close to the subject property address.

Caller Name: JOE RIZZO
DEC Investigator: tdghiosa

Spiller: UNKNOWN
Notifier Name: ALAN BEGA
Caller Agency: CRYSTAL TRANSPORTATION
Contact for more spill info: JOE RIZZO

Spill Class: KNOWN RELEASE WITH MINIMAL POTENTIAL FOR FIRE OR HAZARD; NO DEC RESPONSE; WILLING RP; CORRECTIVE ACTION TAKEN

Spill Date: 02/03/1997
Cause of Spill: EQUIPMENT FAILURE
Meets Cleanup Standards: YES
Penalty Recommended: NO

Material Spilled | Material Class | Quantity Spilled | Units | Quantity Recovered | Units | Resource(s) Affected
--- | --- | --- | --- | --- | --- | ---
#2 FUEL OIL | PETROLEUM | 10.00 | GALLONS | 0.00 | GALLONS | SOIL

Caller Remarks:
caller only stated that it was a computer error that caused the spill - he said it was not his company’s computer that was in error he did not know the name of the company responsible - material spilled to dirt

DEC Investigator Remarks:
Prior to Sept, 2004 data translation this spill Lead_DEC Field was "GHIOSAY"
**02/03/97 SENDING OUT CONTRACTOR TO CLEAN UP; OVERFILL OUT VENT**
**ONT DO DIRT. TRI-STATE TO CLEAN UP.**

HAZARDOUS SUBSTANCE WASTE DISPOSAL SITES IDENTIFIED WITHIN 1/2 MILE SEARCH RADIUS

PLEASE NOTE: Compass directions can vary substantially for sites located very close to the subject property address.

Registry ID 360028
Site Number Id: FORMER 7-UP BOTTLING PLANT
Map Identification Number 339
JOYCE RD
NEW ROCHELLE, NY 10802

ADDRESS CHANGE INFORMATION
Revised street: NO CHANGE
Revised zip code: 10801

NEW YORK STATE DEPARTMENT OF ENVIRONMENTAL CONSERVATION
Division of Hazardous Waste Remediation
Hazardous Substance Waste Disposal Site Study

Inventory Status: Removed from the Hazardous Substance Inventory
Reason site did not qualify for the Inventory:
No source identified

SITE INFORMATION

Site Name: FORMER 7-UP BOTTLING PLANT
Site Street: JOYCE RD
Site City: NEW ROCHELLE
Site Zip: 10802
Region: 3

US EPA No Further Remedial Action Planned? Unknown
Site Code: 1B
Description: INDUSTRIAL SITE - LEAKING TANKS; DRUMS; LAGOONS; OTHER CONTAINERS

Acres: 0.00
Quadrangle: MT. VERNON
Completed Investigation? Phase 2
HRS Score: Unknown
Is Site Active: No
HRS Date: Unknown
Years of Operation: 1966 to Unknown

Site Description:
The site is currently vacant, but was operated until recently by the New York 7-Up Bottling Co. as a bottling plant and warehouse. Contaminated groundwater was identified at the site but appears to originate upgradient, across the railroad trcks. Metal cleaning solvents may have been disposed off-site. Groundwater clean-up was initiated by 7-UP Company.
SITE IMPACT DATA

Affected Media:

Contamination of...
- Surface Water? No
- Groundwater? Yes
- Drinking Water? No

Hazardous Substance Exposed? No
Controlled Site Access? Yes
Ambient Air Contamination? No
Threat of Direct Contact? No
Documented Fish or Wildlife Mortality? No
Impact on Special Status Fish or Wildlife Resource? No
Active Drinking Water Supply? Unknown

Descriptions:

Surface Water:
- nearest: 3000 ft; southeast

Groundwater:
- groundwater depth: 11 ft.

Drinking Water:
- None provided

Fish or Wildlife Mortality:
- None provided

Special Status Fish or Wildlife Resource:
- None provided

Building:
- The site is located in a commercial zone.

THREAT TO THE ENVIRONMENT OR PUBLIC HEALTH

Threat to the Environment or the Public Health: Environment

Threat Posed by Disposed Hazardous Substance:
- Groundwater has been contaminated with VOC’s from an unknown source(s). The source of contamination is believed to be offsite. No private or public drinking water supply wells are known to exist near the site.

HAZARDOUS SUBSTANCES DISPOSED:

- VOCs: Yes
- Semi-VOCs: No
- PCBs: No
- Pesticides: No
- Metals: No
- Asbestos: No
Hazardous Substances Disposed:
Unknown

SELECTED ANALYTICAL INFORMATION:

Samples Collected:
Groundwater, Subsurface

Air: None provided
Surface Water: None provided
Surface Soil: None provided
Waste: None provided
EPToxicity: None provided

Groundwater:
Numerous volatile organic compounds found. Records on file at NYSDEC. Standards have been exceeded for benzene, trichloroethane, trans 1,2-dichloroethene, and 1,1-dichloroethene.

Sediment: None provided

Subsurface Soil:
unknown

Leachate: None provided

TCLP: None provided

AGENCY INFORMATION:

Regulatory Agencies Involved:
Westchester County DOH NYSDEC-referred to DOW in 1993 NYSDOH

Preparer:
Pete Boone (jjs) NYSDOH Env. Engineering Tech June 24, 1994

Hazardous waste codes presented in individual Toxic Information Profiles are defined below.

B002 Petroleum oil or other liquid containing 50 ppm or greater of PCBs but less than 500 ppm PCBs. This includes oil from electrical equipment whose PCB concentration is unknown, except for circuit breakers, reclosers and cable.

B004 PCB Articles containing 50 ppm or greater of PCBs but less than 500 ppm PCBs excluding, small capacitors. This includes oil filled electrical equipment whose PCB concentration is unknown, except for circuit breakers, reclosers and cable.

B007 Other PCB Wastes including contaminated soil, solids, sludges, clothing, rags, and dredge material.

CR02

CR04

D001 Solid waste that exhibits the characteristic of ignitability, but is not listed under any other hazardous waste code.

D002 Solid waste that exhibits the characteristic of corrosivity, but is not listed under any other hazardous waste code.

D003 Solid waste that exhibits the characteristic of reactivity, but is not listed under any other hazardous waste code.

D005 Barium

D006 Cadmium

D007 Chromium

D008 Lead

D009 Mercury

D010 Selenium

D011 Silver

D018 BENZENE

D039 Tetrachloroethylene

F001 The following spent halogenated solvents used in degreasing: Tetrachloroethylene, trichloroethylene, methylene chloride, 1,1,1-trichloroethane, carbon tetrachloride, and chlorinated fluorocarbons; all spent solvent mixtures/blends used in degreasing containing, before use, a total of ten percent or more (by volume) of one or more of the above halogenated solvents or those solvents listed in F002, F004, and F005; and still bottoms from the recovery of these spent solvents and spent solvent mixtures. (T)
The following spent halogenated solvents: Tetrachloroethylene, methylene chloride, trichloroethylene, 1,1,1-trichloroethane, chlorobenzene, 1,1,2-trichloro-1,2,2-trifluoroethane, ortho-dichlorobenzene, trichlorofluoromethane, and 1,1,2-trichloroethane; all spent solvent mixtures/blends containing, before use, a total of ten percent or more (by volume) of one or more of the above halogenated solvents or those listed in F001, F004, or F005; and still bottoms from the recovery of these spent solvents and spent solvent mixtures. (T)

The following spent non-halogenated solvents: Xylene, acetone, ethyl acetate, ethyl benzene, ethyl ether, methyl isobutyl ketone, n-butyl alcohol, cyclohexanone, and methanol; all spent solvent mixtures/blends containing, before use, only the above spent non-halogenated solvents; and all spent solvent mixtures/blends containing, before use, one or more of the above non-halogenated solvents, and, a total of ten percent or more (by volume) of one or more of those solvents listed in F001, F002, F004, and F005; and still bottoms from the recovery of these spent solvents and spent solvent mixtures. (I)*

The following spent non-halogenated solvents: Toluene, methyl ethyl ketone, carbon disulfide, isobutanol, pyridine, benzene, 2-ethoxyethanol, and 2-nitropropane; all spent solvent mixtures/blends containing, before use, a total of ten percent or more (by volume) of one or more of the above non-halogenated solvents or those solvents listed in F001, F002, or F004; and still bottoms from the recovery of these spent solvents and spent solvent mixtures. (I,T)

Cyanides (soluble cyanide salts), not otherwise specified

Sodium azide

Sodium cyanide

2-Propenoic acid (I)

Methane, dichloro-

2-Propenoic acid, ethyl ester

1,3-Isobenzofurandione

Carbon tetrachloride

Ethane, 1,1,1-trichloro-

Ethene, trichloro-

How Toxic Site Locations Are Mapped

Toxics Targeting maps toxic site locations on a computerized version of the U.S. Census map using addresses and map coordinates provided by site owners/operators or government agencies. In order to allow site locations to be verified independently, the information used to map each site is presented in the first section of each Toxic Site Profile, along with a description of the mapping technique used and any address corrections that were made in order to locate toxic sites with incomplete or inadequate site location information. The mapping process is explained below.

Map Identification Number: 12

Site Name: Acme World Manufacturing, Inc.

Site Address: 55 Main Street

Anytown, NY 11797

MAP LOCATION INFORMATION

Site location mapped by:

Address Matching

or Map Coordinate

or Manual Mapping

or Site Visit

Note: Some sites have an address match location and a map coordinate location. Both locations are mapped because they can be equally correct.

ADDRESS CHANGE INFORMATION

Revised Street: NO CHANGE

Revised zip code: NO CHANGE

1) Most toxic sites are mapped by matching addresses provided by site owners/operators or government agencies with locations on a computerized version of the U.S. Census map. These site locations are identified “address-matched.”

2) Some toxic sites are located using map coordinates provided by site owners/operators or government agencies. These site locations are identified “map coordinate.” Map coordinates for Toxics Wastewater Discharges, Toxic Release Inventory sites and Major Oil Storage Facilities should be considered suspect.

3) Incomplete addresses or map coordinates require some site locations to be determined by commercial street maps (manual mapping), site visits, map coordinates from other databases and address location services. Application of any of these methods is identified accordingly.

4) Site addresses are sometimes corrected to eliminate obvious errors that prevent sites from being mapped. All address corrections are noted here.
Information Source Guide

Toxics Targeting’s Environmental Reports contain government and other information compiled on 18 categories of reported known or potential toxic sites. Each toxic site database is described below with information detailing
a) the source of the information, b) the date when each database is covered to and c) when Toxics Targeting obtained the information.

1) National Priority List for Federal Superfund Cleanup: Toxic sites nominated for cleanup under the Federal Superfund program. Annual compilation of special two-page detailed profiles of NPL sites. Also includes delisted NPL sites.
   ASTM required.* Fannie Mae required.** Source: U. S. Environmental Protection Agency.¹

2) Inactive Hazardous Waste Disposal Site Registry: New York State database that maintains information and aids decision making regarding the investigation and cleanup of toxic sites. The Registry's data includes two-page profiles noting site name, ID number, description, classification, cleanup status, types of cleanup, owner information, types and quantities of contaminants, and assessment of health and environmental problems. Also included are sites that qualify for possible inclusion on the Registry. These Registry Qualifying sites may or may not be on the Site Registry.
   ASTM required.* Fannie Mae required.** Source: New York State Department of Environmental Conservation.²

   ASTM required.* Fannie Mae required.** Source: U. S. Environmental Protection Agency.¹

4) CERCLIS: Toxic sites listed in the Federal Comprehensive Environmental Response, Compensation and Liability Information System. No Further Remedial Action Planned (NFRAP) sites are also included.
   ASTM required.* Fannie Mae required.** Source: U. S. Environmental Protection Agency.¹

5) Brownfield Programs: NYS programs for sites that are abandoned, idled or under-used industrial and/or commercial sites where expansion or redevelopment is complicated by real or perceived environmental contamination.
   ASTM required.* Source: New York State Department of Environmental Conservation.²
   (a) Brownfield Cleanup Program (BCP)
   (b) Voluntary Cleanup Program (VCP)
   (c) Environmental Restoration Program (ERP)

6) Solid Waste Facilities: NYS database of solid waste facilities, including, but not limited to, landfills, incinerators, transfer stations, recycling centers.
   ASTM required.* Fannie Mae required.** Source: New York State Department of Environmental Conservation.²

7) RCRA Hazardous Waste Treatment, Storage or Disposal Facility Databases:
      ASTM required.* Fannie Mae required.** Source: New York State Department of Environmental Conservation.²
   (b) RCRA Notifier & Violations Information: U. S. Environmental Protection Agency database of hazardous facilities regulated pursuant to the Resource Conservation and Recovery Act (RCRA).
      ASTM required.* Fannie Mae required.** Source: U. S. Environmental Protection Agency.¹
8) **Spills Information Database:** Spills reported to the DEC as required by one or more of the following: Article 12 of the Navigation Law, 6 NYCRR Section 613.8 (from Petroleum Bulk Storage Regulations) or 6 NYCRR Section 595.2 (from Chemical Bulk Storage Regulations). The database includes active and closed spills reported on or before 9/14/2006. 

ASTM required.* Fannie Mae.**

Data obtained by Toxics Targeting: 2/15/2000.

---

** Fannie Mae's Part X Environmental Hazards Management Procedures specify 1.0 mile searches for "any state or Federal list of hazardous waste sites (e.g. CERCLIS, HWDMs etc.)." Searches for the property and adjacent properties are specified for "chemical manufacturing plants," "obvious high risk neighbors engaging in storing or transporting hazardous waste, chemicals or substances" and "...any documented or visible evidence of dangerous waste handling... (e.g. stressed vegetation, stained soil, open or leaking containers, foul fumes or smells, oily ponds, etc.)" Searches for property and adjacent properties can include sites up to a quarter mile away (W. Hayward, Director, Multi-Family Business Planning and Control, Fannie Mae, personal communication, 5/94).

Environmental Data Resources, Inc. (EDR) Aerial Photo Decade Package is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR’s professional researchers provide digitally reproduced historical aerial photographs, and when available, provide one photo per decade.

When delivered electronically by EDR, the aerial photo images included with this report are for ONE TIME USE ONLY. Further reproduction of these aerial photo images is prohibited without permission from EDR. For more information contact your EDR Account Executive.

Thank you for your business.
Please contact EDR at 1-800-352-0050 with any questions or comments.

EDR City Directory Abstract

Environmental Data Resources, Inc.’s (EDR) City Directory Abstract is a screening report designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR’s City Directory Abstract includes a search and abstract of available city directory data. For each address, the directory lists the name of the corresponding occupant at five year intervals.

Thank you for your business.
Please contact EDR at 1-800-352-0050 with any questions or comments.

Disclaimer - Copyright and Trademark Notice

This Report contains certain information obtained from a variety of public and other sources reasonably available to Environmental Data Resources, Inc. It cannot be concluded from this Report that coverage information for the target and surrounding properties does not exist from other sources. NO WARRANTY EXPRESSED OR IMPLIED, IS MADE WHATSOEVER IN CONNECTION WITH THIS REPORT. ENVIRONMENTAL DATA RESOURCES, INC. SPECIFICALLY DISCLAIMS THE MAKING OF ANY SUCH WARRANTIES, INCLUDING WITHOUT LIMITATION, MERCHANTABILITY OR FITNESS FOR A PARTICULAR USE OR PURPOSE. ALL RISK IS ASSUMED BY THE USER. EDR Environmental LienSearch™ Report

The EDR Environmental LienSearch Report provides results from a search of available current land title records for environmental cleanup liens and other activity and use limitations, such as engineering controls and institutional controls.

A network of professional, trained researchers, following established procedures, uses client supplied address information to:

- search for parcel information and/or legal description;
- search for ownership information;
- research official land title documents recorded at jurisdictional agencies such as recorders' offices, registries of deeds, county clerks' offices, etc.;
- access a copy of the deed;
- search for environmental encumbering instrument(s) associated with the deed;
- provide a copy of any environmental encumbrance(s) based upon a review of key words in the instrument(s) (title, parties involved, and description); and
- provide a copy of the deed or cite documents reviewed.

Thank you for your business.
Please contact EDR at 1-800-352-0050 with any questions or comments.

**LEONARD W. SIMO**

**WESTCHESTER COUNTY CLERK**
The People of the State of New York, by the Grace of God, Free and Independent,

TO ALL TO WHOM THESE PRESENTS SHALL COME, GREETING:

Know ye, That pursuant to Sections 25 and 34 of the Public Lands Law and Findings of the Commissioner of General Services dated July 24, 1997 and in consideration of the sum of One Dollar ($1.00), and other good and valuable consideration, paid by the CITY OF NEW ROCHELLE, a New York municipal corporation having its principal office and place of business at 515 North Avenue, New Rochelle, New York 10801, we have granted and conveyed and by these presents do hereby grant and convey unto the said CITY OF NEW ROCHELLE, its successors and assigns forever, for park, recreation, street and highway purposes, including incidental, necessary municipal business in conjunction therewith, all the right, title and interest of THE PEOPLE OF THE STATE OF NEW YORK in and to the following:

ALL THAT CERTAIN PIECE OR PARCEL OF LAND situate in the City of New Rochelle, County of Westchester, and State of New York, being further described as follows:

BEGINNING at a point on the southerly side of East Main Street at its intersection with the division line between the lands of the People of the State of New York, on the east, and lands now or formerly of Anthony Petro, on the west, said point being distant S. 29° 51' W., 304.28 feet from New Rochelle City Monument No. 4 which is located at the northwesterly corner of the intersection of Pratt and Huguenot Streets; thence N. 52° 02' 34" E., along the southerly bounds of East Main Street, 200 feet to a point in the westerly bounds of lands, now or formerly, owned by the City of New Rochelle, said point being distant S. 02° 32' 30" E., 141.02 feet from the aforesaid Monument No. 4; thence S. 43° 23' 32" E., along the westerly bounds of said lands of the City of New Rochelle, 635 feet to a point in the original high water line of New Rochelle Harbor (formerly called Smuggler Mill Pond); thence S. 52° 02' 34" W., generally along said high water line, 200 feet to a point at the southeast corner of lands, now or formerly, of the Colonial Sand and Stone Company, Inc.; thence N. 43° 23' 32" W., along the easterly bounds of said lands of the Colonial Sand and Stone Company, Inc., 57.9 feet to a point in the southerly bounds of lands, now or formerly, of Harvey A. Turnure (designated as Lot 43); thence N. 52° 02' 34" E., along the southerly bounds of said lands of Turnure, 9.18 feet to a point, thence N. 43° 23' 32" W., along the easterly bounds of said lands of Turnure and then continuing along the easterly bounds of the aforesaid lands of Anthony Petro, 251.12 feet to the point and place of beginning, containing 2.908 acres of land, more or less.

The above described parcel is shown on a map entitled "Boundary Map of New York State Armory at City of New Rochelle, Westchester County" prepared by the New York State Department of Public Works from surveys dated September 1933 and December 1934.
-Intending to convey the following three parcels of land, together with all rights, reservations, and restrictions that may appear therein by the following three deeds:

1. Deed from the City of New Rochelle to the People of the State of New York dated September 4, 1930, recorded in the Westchester County Clerk's Office in Liber 3270 of Deeds at page 274.

2. Deed from the City of New Rochelle to the People of the State of New York dated January 31, 1933, recorded in the Westchester County Clerk's Office in Liber 3333 of Deeds at page 251.

3. Deed from Colonial Sand and Stone Company, Inc. to the People of the State of New York dated June 3, 1935, recorded in the Westchester County Clerk's Office in Liber 3448 of Deeds at page 159.

Reserving to the People of the State of New York the right of public access across an area approximately 20 feet wide along the shoreline adjacent to the New Rochelle Harbor.

This grant is made and accepted upon the condition that said premises shall be improved and maintained for park, recreation, street and highway purposes, including incidental, necessary municipal business in conjunction therewith. In the event that said premises are not improved and maintained for park, recreation, street and highway purposes, including incidental, necessary municipal business in conjunction therewith, the title hereby conveyed shall revert to The People of the State of New York and the Attorney General may institute an action in the Supreme Court for a judgment declaring a revesting of such title in the State.

EXCEPTING AND RESERVING to ourselves all gold and silver mines.

TO HAVE AND TO HOLD the above described premises unto said CITY OF NEW ROCHELLE, its successors and assigns forever, except as aforesaid.
IN WITNESS WHEREOF our First Deputy Commissioner of General Services has executed these letters patent in our name this 24th day of July 1997.

LEONARD N. SPREMO
WESTCHESTER COUNTY CLERK
THIS INDENTURE, made the 4th day of June, nineteen hundred and ninety-seven (1997),

BETWEEN

CITY OF NEW ROCHELLE, a New York municipal corporation with offices at 515 North Avenue, New Rochelle, New York 10801

party of the first part, and

PALMER-PETERSVILLE ASSOCIATES, L.P., a Limited Liability company having its principal place of business at 150 East 59th Street, 22nd Floor, New York, New York 10155

party of the second part.

WITNESSETH, that the party of the first part, in consideration of One Hundred Thousand ($100,000) Dollars paid by the party of the second part, does hereby grant, release unto the party of the second part, the heirs or successors and assigns of the party of the second part forever, all those certain plots, pieces or parcels of land known as the de-mapped portions of Frederic B. Powers Square and Stonelea Place, situate, lying and being in the City of New Rochelle, County of Westchester, and State of New York, as more fully bounded and described as Parcels 1A, IB, and II on Schedule “A” attached hereto.

IN PRESENCE OF:

[Signatures]

CITY OF NEW ROCHELLE

[Seal]

STATE OF NEW YORK, COUNTY OF WESTCHESTER ss.:

On the 4th day of June, 1997 before me personally came PETER A. KORN, to me known, who, being by me duly sworn, did depose and say that he resides at 28 Kewanee Road, New Rochelle, New York, that he is the City Manager of the City of New Rochelle, New York, the municipal corporation described in and who executed the foregoing instrument; that he knows the seal of said corporation; that the seal affixed to said instrument is corporate seal; that it was so affixed by order of the City Council of New Rochelle, and that he signed his name thereto by like order.

Ms. Wanda Calderon  
Freedom of Information Officer  
US EPA Region 2  
290 Broadway, 26th Floor  
New York, NY 10007-1866

Dear Ms. Calderon:

Environmental Liability Management, LLC (ELM) is performing an environmental site assessment (ESA) of the following properties:

- New Rochelle, New York – Section 1 Block 72, Lots 0003, 0005, 0018, 0026, and 0030
- New Rochelle, New York – Section 1 Block 84, Lots 0001, 0005, 0022, 0028, 0034, 0040, 0044, 0048, 0054, 0056, 0060, 0067, 0069, 0073, 0120, and 0110

Please see Table 1 for the corresponding addresses.

Pursuant to the Federal Freedom of Information Act (5 U.S.C 552 et seq.) dealing with the examination and duplication of documents maintained by public agencies, and pursuant to the New York State Public Officer Law, Article 6 Sections 84-90 Freedom of Information Law (FOIL), ELM is requesting any information or copies of files regarding environmental conditions on the above properties, such as environmental permits, notices of violations, spill/discharge incidents, storage or disposal of hazardous substances, Underground Storage Tanks (USTs), Leaking Underground Storage Tanks (LUSTs), asbestos abatement and any other environmental reports that your department may have.

Thank you for your cooperation. Should you need any additional information please feel free to contact me at (212) 581-8023 ext.6.

Sincerely,

Nicole Gorelick-Stratton

RE: Request No: 02-RIN-00730-07

Dear Ms. Gorelick-Stratton,

This is to acknowledge receipt of your Freedom of Information Act (FOIA), 5 U.S.C. 552, request dated January 31, 2007 and received in this office on February 01, 2007, for records related to:

Multiple properties in New Rochelle, NY

The program(s) office(s) that have been assigned this request will be responding to you directly. The Agency has twenty (20) working days to respond to your request, except when you have agreed to an alternate due date or unusual circumstances exist that would require an extension of time under 5 U.S.C. 552 (a) (6) (B).

Include your FOIA request number in all subsequent communications with respect to this assignment. Additionally, for faster processing you may provide your email address.

Thank you.

Respectfully,

Wanda Calderon
FOIA Specialist
UNITED STATES ENVIRONMENTAL PROTECTION AGENCY
Region 2, 290 Broadway

Re: Freedom of Information Request No. 02-RIN-00730-07
Dated: January 31, 2007

Dear Ms. Gorelick-Stratton:

Your request for information has been referred to this branch for response. We have searched the Resource Conservation and Recovery Act (RCRA) files and/or computer database as appropriate to respond to your request. In addition, you may also receive more information from other program areas within this Regional Office.

We were unable to find hazardous waste (RCRA) information concerning the properties at Block 72 Lots 3, 5, 18, 26 & 30, and Block 84 Lots 1, 5, 22, 28, 120, 110, 34, 40, 44, 48, 54, 56, 60, 67, 69 & 73 in New Rochelle, New York.

For information on Underground Storage Tanks (USTs), please contact New York State Department of Environmental Conservation (NYSDEC) at the enclosed address as it is responsible for keeping records and tracking incidents related to USTs.

If you consider this response to be a denial, you may submit a written appeal to HQ FOIA OPERATIONS STAFF, U.S. Environmental Protection Agency (2822T), 1200 Pennsylvania Avenue, N.W., Washington, D.C. 20460. The appeal must be made in writing, and must be received within 30 calendar days of the date of this response to receive consideration. The Agency will not consider appeals received after the 30-day limit. The appeal should be marked "Freedom of Information Act Appeal", and should reference the Freedom of Information Request Number of this response.

Also, RCRA information is now available on the World Wide Web as described on the enclosed sheet.

Please include the above referenced request number in any subsequent communication relating to this response.

Sincerely yours,

Adolph S. Everett, P.E.
Chief, RCRA Programs Branch

Environmental Protection Agency Internet Information

EPA Region 2

While Freedom of Information Act (FOIA) requests will be honored by directly writing to Region 2, EPA provides an increasing amount of environmental media information, and other Regional activities via Internet at http://www.epa.gov.

Region 2 has provided a FOIA Web site http://www.epa.gov/region02/foia/ with several online databases from which the environmental information can be retrieved.

- **“Frequently FOIAed Files”** Web site http://www.epa.gov/region2/foia/fft.htm covers RCRA and many other media Programs. Through this Web site, you can learn about each media Program, associated databases, and special points of interest. In particular, the ability to “directly download” all of the most commonly requested Region 2 Export Files (.xls) and Reports (.pdf) - all compressed for quicker downloading.

EPA Region 2 has established a list of contaminated facilities that are a high priority for cleanup in New York, New Jersey, Puerto Rico and the U.S. Virgin Islands. You can view each facility fact sheet at http://www.epa.gov/region2/waste/cleanup.htm

EPA- Headquarters

- **Envirofacts Data Warehouse** Web site http://www.epa.gov/enviro/index_java.html is a one-stop source to the environmental information. This Web site provides access to several EPA databases with information about environmental activities that may affect air, water and land anywhere in the United States.
- **“Window to My Environment”** Web site http://www.epa.gov/enviro/wme is a powerful tool that provides a wide range of federal, state and local information about environmental conditions and futures in an area of your choice.
- **The Enforcement and Compliance History Online (ECHO)** Web site http://www.epa.gov/echo/ provides a list of all inspections and enforcement under most of the environmental statutes.
- **Right-To-Know Network (RTK Net),** a non-EPA Web site http://www.rtk.net/ on-line query engine provides free access to numerous databases and resources on environment.

REVISED April 25, 2006
February 20, 2007

Re: Freedom of Information Act Request No.(s): SEE ATTACHED

Subject: SEE ATTACHED

Dear FOIA Requester:

The subject sites are not listed on the CERCLIS or NFRAP lists at the present time.

As of February 15, 1995, CERCLIS no longer includes sites which EPA has assessed and designated “No Further Remedial Action Planned” (NFRAP). A NFRAP designation means, to the best of EPA’s knowledge, Superfund has completed its assessment at a site and determined no further steps would be taken to list these sites on the National Priorities List (NPL) unless information is received at a later time indicating this decision was not appropriate. A NFRAP decision does not necessarily mean that there is no hazard associated with a given site; it means only that based upon available information, the location is not judged to be a potential NPL site.

Also, the absence of a facility from the CERCLIS list should not be construed as a determination by the EPA that the facility has not been affected by the presence of any hazardous waste. The absence of a facility from this list means that EPA has not received information indicating that there has been a release or threat of hazardous substances at or from the facility. Therefore, EPA has not performed an assessment at this location to date. As with any parcel of real property, EPA may be called upon to assess the property for a release of hazardous substances should conditions warrant.

In the interest of saving time and paper, I suggest that in the future you identify the specific properties you have an interest in by accessing the following web sites. The information available through these web sites should address any future inquires you may have.

This is the address for the Superfund Information Systems homepage - http://www.epa.gov/superfund/sites. From this site you may obtain a list of all sites which are currently on the CERCLIS database and sites archived from CERCLIS. Additionally you can access the RODS database from here as well as download reports or order a variety of site information products on line.
This is the site for the National Response Center maintained by the U.S. Coast Guard - http://www.nrc.uscg.mil. From this site you can access information regarding spills which have occurred from 1990 to the present.

This is the site for the National Technical Information Service maintained by the U.S. Department of Commerce - http://ntis.gov. From this site you can order subscription datafiles on CD-ROMs and diskettes which allow you to run your own CERCLIS reports.

We do not consider this a denial, but if you do, you have the right to appeal to the Office of Environmental Information, Records, FOIA, and Privacy Branch (2822T), 1200 Pennsylvania Avenue, NW, Washington, DC 20460. The appeal must be in writing, and it must be received at this address no later than 30 calendar days from the date of this letter. The Agency will not consider appeals received after the 30-day limit. The appeal may include as much or as little related information as you wish, as long as it clearly identifies the determination being appealed (including the assigned FOIA number). For quickest possible handling, the appeal letter and its envelope should be marked “Freedom of Information Act Appeal.”

This determination applies to Superfund program records, your request has also been assigned to other programs within the Agency for separate replies. Please contact Wanda Calderon, at (212) 637-3668, on any questions concerning your pending request.

Sincerely,

Leslie H. Peterson, Chief
Resource Management/Cost Recovery Section
Emergency and Remedial Response Division

Re: Freedom of Information Request No. 02-RIN-00730-07
Dated: January 31, 2007
Subject: Multiple properties in New Rochelle, NY

Dear Ms. Gorelick-Stratton:

Your request for information has been referred to this branch for response. We have searched our databases as appropriate to your request. However, our research did not reveal any air or water information that was responsive to your request. In addition, you may also receive more information from other program areas within this Regional Office.

Please be advised that now you can retrieve the environmental profile of a facility including information regarding toxic chemical releases, water permits, hazardous waste handling processes, “Superfund” status and air emissions from the EPA’s web page. The address is www.epa.gov/enviro.

If you consider this response to be a denial, you may submit a written appeal to HQ FOIA OPERATIONS STAFF, U.S. Environmental Protection Agency (2822T), 1200 Pennsylvania Avenue, N.W., Washington, D.C. 20460. The appeal must be made in writing, and must be received within 30 calendar days of the date of this response to receive consideration. The Agency will not consider appeals received after the 30-day limit. The appeal should be marked “Freedom of Information Act Appeal,” and should reference the Freedom of Information Request Number of this response.

Please include the above referenced request number(s) in any subsequent communication relating to this response.

Sincerely yours,

City of New Rochelle Fire Department
90 Beaufort Place
New Rochelle New York 10801

Dear Fire Department:

Environmental Liability Management, LLC (ELM) is performing an environmental site assessment (ESA) of the following properties:

- New Rochelle, New York – Section 1 Block 72, Lots 0003, 0005, 0018, 0026, and 0030
- New Rochelle, New York – Section 1 Block 84, Lots 0001, 0005, 0022, 0028, 0034, 0040, 0044, 0048, 0054, 0056, 0060, 0067, 0069, 0073, 0120, and 0110

Please see Table 1 for the corresponding addresses.

Pursuant to the Federal Freedom of Information Act (5 U.S.C 552 et seq.) dealing with the examination and duplication of documents maintained by public agencies, and pursuant to the New York State Public Officer Law, Article 6 Sections 84-90 Freedom of Information Law (FOIL), ELM is requesting any information or copies of files regarding environmental conditions on the above properties, such as environmental permits, notices of violations, spill/discharge incidents, storage or disposal of hazardous substances, Underground Storage Tanks (USTs), Leaking Underground Storage Tanks (LUSTs), asbestos abatement and any other environmental reports that your department may have.

Thank you for your cooperation. Should you need any additional information please feel free to contact me at (212) 581-8023 ext.6.

Sincerely,

Nicole Gorelick-Stratton

New York State Department of
Environmental Conservation
21 South Putt Corners Road
New Paltz, NY 12561-1620

Dear FOIL Department:

Environmental Liability Management, LLC (ELM) is performing an environmental site assessment (ESA) of the following properties:

- New Rochelle, New York – Section 1 Block 72, Lots 0003, 0005, 0018, 0026, and 0030
- New Rochelle, New York – Section 1 Block 84, Lots 0001, 0005, 0022, 0028, 0034, 0040, 0044, 0048, 0054, 0056, 0060, 0067, 0069, 0073, 0120, and 0110

Please see Table 1 for the corresponding addresses.

Pursuant to the Federal Freedom of Information Act (5 U.S.C 552 et seq.) dealing with the examination and duplication of documents maintained by public agencies, and pursuant to the New York State Public Officer Law, Article 6 Sections 84-90 Freedom of Information Law (FOIL), ELM is requesting any information or copies of files regarding environmental conditions on the above properties, such as environmental permits, notices of violations, spill/discharge incidents, storage or disposal of hazardous substances, Underground Storage Tanks (USTs), Leaking Underground Storage Tanks (LUSTs), asbestos abatement and any other environmental reports that your department may have.

Thank you for your cooperation. Should you need any additional information please feel free to contact me at (212) 581-8023 ext.6.

Sincerely,

Nicole Gorelick-Stratton

FOIL #R2-06-1631

Mini Raygorodetsky/Env Liability Mgmt of NY LLC
212-581-8023 Ext 3
Fax 212-581-8434

RE: 83-01 to 83-19 38th Ave
    37-21 to 37-41 33rd St
    37-30 to 37-40 34th St in Queens
    Block 375, Lot 33

Dear Ms. Raygorodetsky:

NYSDEC/Region 2 has reviewed your request for the above referenced records under New York State’s Freedom of Information Law (FOIL). Please note that most of our records are filed by number under the names of individuals or corporations. We have no way of locating or retrieving records if they are filed under names or addresses other than those you have provided.

If no records have been located, this does not necessarily mean, and should not be interpreted to mean that there have never been any violations, complaints, claims, investigations or inquiries involving those names or addresses. We cannot make any representations as to whether there are or have been any such violations, complaints, claims, investigations or inquiries.

نة After a diligent search, no records could be located for the names and/or addresses you provided.

Thank you for your request. If additional information is needed, please call Gloria Silva/FOIL Secretary at (718) 482-4507, or fax your response to me.

Sincerely yours,

[Signature]

NICOLE GORELICK-STRATTON
ENVIRONMENTAL LIABILITY MANAGEMENT OF NY
250 WEST 57TH STREET SUITE 2421
NEW YORK NY 10107

RE: FOIL #096-3/07
NEW ROCHELLE ADDRESSES
DATE RECEIVED: FEBRUARY 1, 2007

DEAR NICOLE GORELICK-STRATTON:

This letter acknowledges receipt of your request for access to records under New York State's Freedom of Information Law (FOIL). Your request has been forwarded to T. Ghiosay of the Spill Prevention and Response Program. Within twenty (20) business days, you can expect a response from the regional program as to whether such documents are in their custody. Please find enclosed spill report sheets for the referenced location. You may wish to contact Mr. Ghiosay directly at (914) 428-2505 ext 361 for further information about these spills. Please remit a check or money order made payable to NYS DEC in the amount of $8.50 for these 34 pages. You may wish to contact the Westchester County Health Department for any records in their custody.

If programs have records, you will have an opportunity to arrange to obtain access to the records. There is no charge to review records or for copies of seven or fewer pages. By law, copy charges will not exceed 25 cents per page or the actual cost of copying. Photographs, maps, oversized documents, videotapes or audio tapes generally cost more than 25 cents per page to copy. You may be required to pay a deposit prior to copies being made and/or to pay all copy charges prior to copies being sent.

If all records are not provided because the records are excepted from disclosure, you will be notified of the reasons and of your right to appeal the determination.

January 31, 2007

Mr. Robert "Jake" W LoCicero
Interim Records Access Officer
New York State Department of Health
Corning Tower
Empire State Plaza
Room 2348
Albany, NY 12237

Dear Mr. LoCicero:

Environmental Liability Management, LLC (ELM) is performing an environmental site assessment (ESA) of the following properties:

- New Rochelle, New York – Section 1 Block 72, Lots 0003, 0005, 0018, 0026, and 0030
- New Rochelle, New York – Section 1 Block 84, Lots 0001, 0005, 0022, 0028, 0034, 0040, 0044, 0048, 0054, 0056, 0060, 0067, 0069, 0073, 0120, and 0110

Please see Table 1 for the corresponding addresses.

Pursuant to the Federal Freedom of Information Act (5 U.S.C 552 et seq.) dealing with the examination and duplication of documents maintained by public agencies, and pursuant to the New York State Public Officer Law, Article 6 Sections 84-90 Freedom of Information Law (FOIL), ELM is requesting any information or copies of files regarding environmental conditions on the above properties, such as environmental permits, notices of violations, spill/discharge incidents, storage or disposal of hazardous substances, Underground Storage Tanks (USTs), Leaking Underground Storage Tanks (LUSTs), asbestos abatement and any other environmental reports that your department may have.

Thank you for your cooperation. Should you need any additional information please feel free to contact me at (212) 581-8023 ext.6.

Sincerely,

Nicole Gorelick-Stratton

Environmental Liability Management
250 West 57th St., Suite 2421
New York, New York 10107

Re: FOIL #07-02-021
Environmental site assessment of
properties in New Rochelle

Dear Ms. Gorelick-Stratton:

This will acknowledge receipt of your January 31, 2007 request for copies of
documents under the Freedom of Information Law.

We have forwarded your request to appropriate Department program units to
identify documents that are responsive to your request and which may be made available
under provisions of the Freedom of Information Law.

We estimate that within 20 business days we will complete your request or
determine the availability of documents responsive to your request or we will notify you in
writing if the responsible program areas should require additional time to locate, assemble
and review responsive documents.

Please be aware that under the rules and regulations of the New York State
Department of Health for implementation of the Freedom of Information Law, there is a fee
of $0.25 per page for providing copies of documents and/or computer printouts, $6.00 for
data files on a diskette (IF AVAILABLE) $60.00 for files on CD (IF AVAILABLE) and
$1.00 per page for labels (IF AVAILABLE).

When the information or documents have been identified, you will be advised of the
cost and how payment should be made.

Sincerely,

[Signature]

Robert "Jake" LoCicero, Esq.

Re: FOIL # 07-02-021  
Echo Bay Area

Dear Ms. Gorelick-Stratton:

Your request, under provisions of the Freedom of Information Law (FOIL), for environmental records regarding Echo Avenue locations, has been reviewed by the Records Access Office (RAO).

The responsible program area within the Department (the Bureau of Environmental Exposure Investigation) has forwarded to RAO documents as responsive to your request. Per your phone conversation with a representative from RAO, documentation regarding an inactive hazardous waste site located at 78 Echo Ave, which is less than 0.5 miles from the locations given in your request, is included in the responsive material.

Please be advised that under authority of the New York Public Officers Law (POL) § 87.2(b), some parts of these materials have been redacted as their provision would involve an unwarranted invasion of personal privacy including the name and personal phone number of an individual involved in contamination.

You may appeal this denial of access in writing within 30 days to the Records Access Appeals Officer, Public Affairs Office, Empire State Plaza, 1455 Corning Tower, Albany New York 12237-0002.

Under the rules and regulations of the New York State Department of Health for implementation of the Freedom of Information Law, there is a fee of $.25 per page for providing copies of documents and/or computer printouts. Please submit a check to my attention payable to the New York State Department of Health (Corning Tower, Room 2348, Albany, New York 12237-0044) in the amount of $256.50 and we will forward the 1,026 pages of responsive materials to you.
If we do not receive your payment within 30 days, we will assume that you no longer wish to receive the materials, and it will be sent back to the originating unit. Accordingly, any future requests for information will require an initial deposit before processing.

Sincerely,

[Signature]

Robert "Jake" LoCicero, Esq;
Records Access Office

CC: Records Access Appeals Officer
January 31, 2007

Mr. Robert "Jake" W LoCicero
Interim Records Access Officer
New York State Department of Health
Corning Tower
Empire State Plaza
Room 2348
Albany, NY 12237

Dear Mr. LoCicero:

Environmental Liability Management, LLC (ELM) is performing an environmental site assessment (ESA) of the following properties:

- New Rochelle, New York – Section 1 Block 72, Lots 0003, 0005, 0018, 0026, and 0030
- New Rochelle, New York – Section 1 Block 84, Lots 0001, 0005, 0022, 0028, 0034, 0040, 0044, 0048, 0054, 0056, 0060, 0067, 0069, 0073, 0120, and 0110

Please see Table 1 for the corresponding addresses.

Pursuant to the Federal Freedom of Information Act (5 U.S.C 552 et seq.) dealing with the examination and duplication of documents maintained by public agencies, and pursuant to the New York State Public Officer Law, Article 6 Sections 84-90 Freedom of Information Law (FOIL), ELM is requesting any information or copies of files regarding environmental conditions on the above properties, such as environmental permits, notices of violations, spill/discharge incidents, storage or disposal of hazardous substances, Underground Storage Tanks (USTs), Leaking Underground Storage Tanks (LUSTs), asbestos abatement and any other environmental reports that your department may have.

Thank you for your cooperation. Should you need any additional information please feel free to contact me at (212) 581-8023 ext.6.

Sincerely,

Re: FOIL REQUEST # 07-02-021

Dear Ms. Gorelick-Stratton:

Your request, under provisions of the Freedom of Information Law (FOIL), has been completed since February 28, 2007. A copy of your request is enclosed for your reference.

Please submit a check payable in the amount of $256.50 to the New York State Department of Health (Records Access Office, Corning Tower, Room 2348, Albany, New York 12237).

If you are no longer interested in obtaining the material, please contact my office in thirty (30) business days or no later than June 1, 2007 so that we can close the file.

Thank you.

Very truly yours,

Robert “Jake” LoCicero, Esq.

As an authorized representative of the above named facility, I affirm under penalty of perjury that the information displayed on this form is correct to the best of my knowledge. Additionally, I recognize that I am responsible for assuring that this facility is in compliance with all Sections of the Westchester County Sanitary Code, Article XXV.

- The facility must be re-registered if there is a transfer of ownership;
- The Department must be notified within 30 days prior to adding, replacing, reconditioning, or permanently closing a stationary tank;
- The facility must be operated in accordance with the code for storing petroleum under the Westchester County Sanitary Code, Article XXV;
- Any new facility or substantially modified facility must comply with Article XXV of the Westchester Sanitary Code;
- **THIS CERTIFICATE MUST BE POSTED ON THE PREMISES AT ALL TIMES.**
- Posting must be at the tank, at the entrance of the facility, or the main office where the storage tanks are located;
- Any person with knowledge of a spill, leak or discharge must report the incident to the Westchester County Department of Health immediately at 914-637-4703 and the New York State Department of Environmental Conservation at 1-800-457-7362.

Re: New Rochelle Municipal Yard  

Dear Mr. Grzyb:  

This is a follow-up to your letter of April 7, 1998 in which several issues raised during a field inspection were to be addressed. The status of these issues are as follows:

1. Bids have been received to install an oil separator to connect all floor drains in the garage to the sanitary sewer system. As soon as the job is awarded, I will advise you of the anticipated completion date.

2. The 2,000 gallon tank that failed the integrity test has been removed.

3. Soils below the failed tank have been tested and information provided to the NYSDEC. The excavation was backfilled as per NYSDEC. A purchase order has been given to Tri-State Environmental Services for soil testing at the “cleanout pile”. Results will be forwarded as soon as it is received by this office.

4. At the present time, the footing drains will not be included in the oil separator.

Environmental Site Assessment User-Furnished Information and Background Information Checklist

1. Person/Party Requesting the Assessment (i.e., “User”)
   Name: George Kruse c/o Forest City Residential
   Address: 1775 Broadway, Suite 701
   Phone: 212-586-4182
   Fax: 212-586-6097
   Objective of Evaluation: Potential purchase

2. Facility: Industrial/Commercial
   Address: Multiple

3. Phone: Multiple

5. County: Westchester

6. Tax Block Number(s): see attached

7. Tax Lot Number(s): see attached

8. Standard Industrial Classification (SIC) No.: multiple

9. Current Owner of Property: see attached

10. Current Operators: Multiple

11. Size of Facility: 26 acres Number of Buildings: See tax records
    Approximate Square Feet of Buildings: See tax records

12. Provide a brief history of the site development ownership and operational history (to the extent readily known).
    see attached
The following is a list of documents and information which must be provided (if the information exists) to Environmental Liability Management of New York, LLC (ELM) in preparing your Phase I Assessment. Check the appropriate boxes below, sign, and return this along with copies of any available documents or information pertaining to any “Yes” responses. This will be attached to and made part of your completed report. Please note that missing or incomplete information or questions not responded to, could result in a determination that our “all appropriate inquiry” is not complete.

16. Description of current site operations, including layout drawings or sketches
17. Title report/chain of title
18. Tax assessor records (previous owner and occupants)
19. Purchase price analysis (if lower than comparable)
20. Current and historical photographs of site
21. Are you aware of any activity use limitations (AULs), such as engineering controls, land use restrictions, or institutional controls that are in place at the property and/or that have been filed or recorded in a registry under federal, tribal, state or local law?
22. As the user of this Phase I assessment, do you have any specialized knowledge or experience related to the property or nearby properties? For example, are you involved in the same line of business as the current or former occupant(s) of the property or an adjoining property such that you would have specialized knowledge of the chemicals and processes used by this type of business?
23. Does the purchase price being paid for this property reflect the fair market value of the property? If you conclude that there is a difference, have you considered whether the lower purchase price is due to environmental conditions/contamination that is known or suspected to be present at the property?
24. As the user of this Phase I assessment, based upon your personal knowledge and experience related to the property, are there any obvious indicators that point to the presence or likely presence of environmental contamination at the property?
25. Purchase price analysis (if lower than comparable)

I have reviewed the above list of questions and have provided responses that are truthful to best of my knowledge as of this specified date below and have provided copies of documents and information that I know to exist and that could be reasonably ascertained.

Environmental Site Assessment – Interview Questionnaire
Echo Bay Site, New Rochelle, New York

Questionnaire to be answered by Key Site Manager and Major Occupants.

Please answer all questions to the best of your actual knowledge. Please call with any questions or comments. Fax to return to our office (212) 581-8434.

Mimi S. Raygorodetsky: Office (212) 581 8023, Cell phone (917) 952 9906.

1) When were the current buildings constructed? Do you have surveyed drawings? Blueprints? Geotechnical subsurface studies?
   
   No

2) Have there been any renovation or additions since initial construction?
   
   No - in last 6 yrs.

3) Is there any historic fill on-site? (Construction and demolition debris? Ash? Dredge spoils?)
   
   No

4) Have there been any asbestos assessment or abatement activities at the property? If there is asbestos on-site do you have an operations and maintenance plan?
   
   No

5) Please describe land use at the property prior to construction of the current buildings.
   
   No knowledge.

6) Please describe activities at the site since construction of the current buildings. Commercial activities such as dry cleaning and auto repair are of particular interest to this study.
   
   Only for H

7) Do municipal water and sewers service the site, or does it rely on private wells and/or a septic system?

   No water, no sewer
8) Are you aware of any wells, public or private, on or near the subject property?  
**No**. No knowledge.

9) Please indicate the nature and frequency of trash removal from the subject property.  
**Dumpster, as needed**.

10) Are you aware of the use, storage or production of any hazardous materials (petroleum products, solvents, paints, pesticides, etc) in any part of the subject site?  
**No**.

11) Are any environmental permits or licenses held currently, or in the past, relating to the property?  
**No**.

12) Are there any registrations held for underground or above ground storage tanks at the property (NYSDEC, NYCDOB, FDNY)?  
**No**.

13) Have any previous environmental reports, audits or investigations been performed at the site?  
**No**.

14) Does the site or any part of the site operate under a community right-to-know plan, safety plan, preparedness and prevention plan, spill prevention, countermeasure or control plan?  
**No**.

15) Are you aware of any reports regarding hydrogeologic or geotechnical conditions on the property or surrounding area?  
**No**.
16) Please provide copies of any notices or other correspondence from any government agency relating to past or current violations of environmental laws with respect to the property or relating environmental liens encumbering the property. 

No.

17) Please provide copies of any hazardous waste generator notices or reports.

No.

18) Please advise of a) any pending, threatened, or past litigation relevant to hazardous substances or petroleum products in, on or from the property, B) any pending, threatened or past administrative proceedings relevant to hazardous substances or petroleum products in, on or from the property; and c) any notices from any government entity regarding any possible violation of environmental laws or possible liability relating to hazardous substances or petroleum products.

No.

19) Please describe your relationship to the property – owner, tenant, manager, super, etc.? 

Employee or it for it.

Mimi S. Raygorodetsky: Office (212) 581 8023, Cell phone (917) 952 9908.

1) When were the current buildings constructed? Do you have surveyed drawings? Blueprints? Geotechnical subsurface studies? 1917

2) Have there been any renovation or additions since initial construction?
   YES GARAGE MID 60's - CORRUGATED METAL

3) Is there any historic fill on-site? (Construction and demolition debris? Ash? Dredge spoils?) NO - SAME SINCE BEEN HERE
   SHORELINE

4) Have there been any asbestos assessment or abatement activities at the property? If there is asbestos on-site do you have an operations and maintenance plan? NO KNOWLEDGE OF ANY ON-SITE

5) Please describe land use at the property prior to construction of the current buildings. VACANT

6) Please describe activities at the site since construction of the current buildings. Commercial activities such as dry cleaning and auto repair are of particular interest to this study. MAINTENANCE GARAGE
   ALL REPAIR + MAINTENANCE OF VEHICLES + MACHINES OCCURS IN NEW GARAGE
   ALL CITY VEHICLES EXCEPT LIV

7) Do municipal water and sewers service the site, or does it rely on private wells and/or a septic system?
   SEWER + STORM WATER - YES - GOES TO WPCP + OIL WATER SEPARATOR
   PORTABLE WATER SUPPLIED BY UNITED WATER COMPANY OF NEW ROCHELLE
8) Are you aware of any wells, public or private, on or near the subject property? No.

9) Please indicate the nature and frequency of trash removal from the subject property. Recyclables (paper, bottles, etc) M-F
   oil dr, oil water separator + waste oil - as needed.

10) Are you aware of the use, storage or production of any hazardous materials (petroleum products, solvents, paints, pesticides, etc) in any part of the subject site? Yes - See attached machine that uses mineral spirits to clean tools. At night, machine burns off differing impurities + ashes are removed + spirits are recycled.

11) Are any environmental permits or licenses held currently, or in the past, relating to the property? No

12) Are there any registrations held for underground or above ground storage tanks at the property (NYSDEC, NYCDOB, FDNY)? Yes.

13) Have any previous environmental reports, audits or investigations been performed at the site? Yes - I can contact Kaz? boss.
   City Engineer +
   Deputy Commissioner - 914 x 654 2134

14) Does the site or any part of the site operate under a community right-to-know plan, safety plan, preparedness and prevention plan, spill prevention, countermeasure or control plan? No
   NREDS are kept on site
   3x Emergency spill kits

15) Are you aware of any reports regarding hydrogeologic or geotechnical conditions on the property or surrounding area? Yes
   get Dr. Kaz.
16) Please provide copies of any notices or other correspondence from any
government agency relating to past or current violations of environmental
laws with respect to the property or relating environmental liens
encumbering the property. Yes Dec has copies
From KAS. 814-654-2353.

17) Please provide copies of any hazardous waste generator notices or Mark Zulli
reports. None Dept of Finance has manifests.
KAS has soil waste manifests.

18) Please advise of a) any pending, threatened, or past litigation relevant to
hazardous substances or petroleum products in, on or from the property,
B) any pending, threatened or past administrative proceedings relevant to
hazardous substances or petroleum products in, on or from the property;
and c) any notices from any government entity regarding any possible
violation of environmental laws or possible liability relating to hazardous
substances or petroleum products. Issues with petroleum -
Presently in the process of complying with OES demands.

19) Please describe your relationship to the property – owner, tenant,
manager, super, etc.

TANKS REMOVED

OF GARAGES
1998 > Dates when 2 USTs were removed
2001
2x 5000 gallons
Diesel + Gasoline

of Garage
2003 - removed 2500 Gal Waste Oil UST.

E of Garage -
Foundation of former sewer pump station - Dashed line
25 feet deep. Collects underground water - contaminated.
Plan is to remove water + soil in this
Need to dewater -
Doing w/ DEC - Todd Gilmore.

Current tanks:

W Side of garage - 1x 5000 Gal Fuel Oil
Oil Water Separator
2 PST - 1x 10000 Gal Gasoline
1x 10000 Gal Diesel > Installed 2003
> Found contamination + Foundation.

REMEDICATION:

[2001]
HES - Hydra Environment Services
Installed 6 wells
Need Contaminated Soil + GW

[2004]
S. DiPalma - 3 or 4 additional Wulls
Installed, sprcking wells. E of Garage.
Can't find report.
Wells are in, but DEC stopped operation.
Said soil had to be cleaned first.
2006 - EMI - Tested soil & GW in area where foundation is located. Chemtech - data.

Work is being bid now:

1. Cleaning out GW of contaminated vault/foundation.

2. DEC requires more investigation btw two garages. Plan due to DEC by 4/28/07.

Re: Preliminary Geotechnical Report
Echo Bay Project
New Rochelle, New York
MRCE File No. 10819

Dear Mr. Kruse:

In accordance with our proposal dated January 12, 2007, we have completed a preliminary subsurface investigation for the referenced development. We summarize herein our interpretation of the subsurface conditions encountered and provide preliminary recommendations for foundation design.

PROJECT DESCRIPTION

The site is located adjacent to Echo Bay in New Rochelle, New York (Sheet No. 1). At present, it is occupied mainly by parking lots and warehouse type structures. Those will be demolished for the new construction.

Proposed site development consists of low-rise mixed use structures with a large number of residential buildings (Sheet No 2). We understand that no basements are planned. The waterfront will be restored and will include a shoreline trail and esplanade.

Based on existing topographic maps, present grades are between Elev. 10 and 30. All elevations in this report refer to 1929 National Geodetic Vertical Datum (NGVD) in which Elev. 0 is equal to Mean Sea Level at Sandy Hook, New Jersey, in 1929.

SUBSURFACE INVESTIGATION

A total of seven borings were drilled at the site between February 12 and February 21, 2007 by CMI Subsurface Investigations, Inc. of Tappan, New York, under the continuous inspection of our Resident Engineer, Mr. Jerry Chan. The originally proposed investigation consisted of ten borings (Boring B-1 through B-10). Three of those borings were not drilled because of access restrictions. We understand that those borings may be drilled at a later date. Approximate locations of the drilled borings are shown on Sheet No. 3. Sheet No. 3 also shows locations of the three borings which were not drilled (Borings B-1, B-3, and B-10). The as-drilled boring locations and ground surface elevations will be surveyed by a licensed surveyor subcontracted by CMI.

Borings B-8 and B-9 encountered shallow obstructions and had to be drilled at off-set locations (Borings B-8A and B-9A).

The borings were made with a truck-mounted drill rig using rotary techniques with casing and drilling mud to stabilize the borehole. All borings were drilled and sampled through the soil overburden and at least 10 feet into bedrock. At regular intervals not exceeding 5 feet, representative soil samples were obtained in the borings with a 2-inch O.D. split-spoon sampler driven with a 140-pound hammer free falling 30 inches. The number of hammer blows required to advance the sampler through each of four, 6-inch drive intervals was recorded. The Standard Penetration Test (SPT) resistance, expressed in blows per foot (BPF), also termed the N-value,
is an indication of the relative density of the material sampled. Where soils were too dense for the sampler to penetrate a full 12 inches, or where gravel, cobbles or boulders were encountered, the sampler was driven until 100 blows were administrated and the actual penetration of the sampler was measured and recorded. Recovered split-spoon soil samples were placed in jars and were delivered to our in-house laboratory for verification of field classifications. Individual sample descriptions are provided on the boring logs in Appendix A.

In each boring, a minimum of two 5-ft rock core samples were taken. Rock cores were recovered using a double tube, NX-size core barrel which recovers rock core approximately two inches in diameter. Our field engineer logged each core run, sketched the jointing patterns, measured recovery and calculated the Rock Quality Designation (RQD). Rock core recoveries and RQD are provided on the boring logs. Cored recoveries represent the length of core recovered divided by the length of core run expressed as a percentage. The Rock Quality Designation is the sum of the lengths of recovered core fragments four inches or longer between natural breaks divided by the length of the core run expressed as a percentage. Recovered rock cores were delivered to our laboratory for verification of field classifications. Field sketches of the recovered cores are attached to the boring logs.

Observation wells (piezometers) were installed in Borings B-2P and B-7P to determine the groundwater level within the site. The piezometers consist of a 1-1/4 inch I.D. PVC pipe extending to a depth up to 33 feet, with a 10-foot slotted screen at the bottom. Water levels were measured during and after the exploration program and are recorded on the Piezometer Record attached to the boring logs in Appendix A.

Other Nearby Investigations Our in-house files contain information from a 1975 boring investigation performed at the District Treatment Plant located immediately to the northeast. Logs of those borings are attached in Appendix B.

SUBSURFACE CONDITIONS

The subsurface conditions at the site are influenced by the original location of the shoreline. Sheet No. 4 shows the limits of Echo Bay from an 1895 USGS geology map. That map indicates a larger bay inlet within the northeast portion of the site and a stream entering the bay near the present Stephenson Boulevard. More recent USGS maps (e.g., Sheet No. 1) also show that inlet to be larger than the present conditions shown on a recent photograph on Sheet No. 3. That inlet was likely partially filled during development of the area. The bay inlet within the southwest portion of the site appears to be smaller on the 1895 map than at the present time. The site history results in somewhat variable subsurface conditions within the site, owing to filling in stages with fill materials from different sources.
In general, the subsurface profile consists of a sandy fill layer overlying local deposits of natural sand, decomposed rock and bedrock. In the middle portion of the site, in Borings B-4, B-5, B-6, and B-8A, bedrock was encountered in shallow depths ranging from 3 to 7 feet directly beneath the fill. No natural sand deposits were encountered. The upper 1 to 5.5 feet (Boring B-6) of the bedrock profile were highly weathered and, hence, were sampled with a split-spoon sampler.

Borings drilled southwest and northeast of the above borings encountered natural sand deposits and deeper bedrock. Borings B-2 and B-7 indicate that the surface of bedrock in those areas deepens likely due to weathering effects. The top of decomposed rock was at depths of 11 to 13.5 feet. Weathered bedrock was encountered at depths of 22 to 23 feet.

Boring B-9 was likely drilled within the original bay inlet limits and encountered 13.5 feet of fill overlying about 25 feet of stratified sand deposits with boulders and bedrock at a depth of 38.5 feet. The top 2 feet of the bedrock profile were weathered. Hence it may be expected that similar deep bedrock conditions may be encountered within the area of the former bay inlet limits at the northeast portion of the site.

General descriptions of the soil and rock strata encountered are summarized below in order of their occurrence with depth:

*Stratum F - Fill*  The uppermost material in each boring is a sandy fill, typically up to 3 to 13.5 feet thick. Most borings had to penetrate pavement at the surface. The fill typically consists of loose to medium compact, gray to black fine to coarse sand with various amount of silt and gravel, and trace of rock fragments and miscellaneous debris (such as vegetation, wood and glass). As suggested by Boring B-9, some obstructions may be present within this layer. N-values range widely.

*Stratum S1 - Loose Sand*  In Borings B-2P and B-9A, the fill layer is underlain by a layer of loose sand ranging from 4 to 10 feet thick. It is of an alluvial or glacial origin and generally consists of gray to black, fine to medium sand with various amount of silt, occasionally interlayered with clayey silt. N-values in this layer range were less than 10 blows per foot (bpf).

*Stratum S2 - Medium Compact to Very Compact Sand*  This stratum, of glacial origin, was encountered in Borings B-7P and B-9A. It typically consists of medium compact to very compact, gray to brown fine to coarse sand with various amounts of silt and gravel, and trace clay and rock fragments. It is occasionally found underlying the fill or the loose sand stratum, with thickness ranging from 5 to 15 feet. Occasional boulders may be encountered in Stratum S2. N-values are typically over 24 bpf.
Stratum DR - Decomposed Rock  This stratum was only encountered in Borings B-2P and B-7P and comprises very compact, brown to dark gray fine to coarse sand, some silt, and various amounts of rock fragments such as pegmatite and mica schist. N-values are in excess of 57 bpf.

Stratum WR/R - Weathered Rock and Bedrock  All borings except for Boring B2-P encountered up to 5 feet of highly weathered rock at the top of the bedrock profile. This weathered layer typically consists of very compact, brown to dark gray fine to coarse sand, some silt and rock fragments, and trace of mica with pegmatite and gneissic schist fragments. N-values are in excess of 100 bpf. Below the weathered zone, the bedrock is typically medium hard to hard, granitic or schistose gneiss, and gneissic schist or granite with some pegmatite zones. Core recoveries in the sound bedrock generally varied from 46 to 99 percent and Rock Quality Designation (RQD) varied from 0 to 96 percent.

Groundwater  Groundwater levels were observed in observation wells installed in Borings B-2P and B-7P. Groundwater depth was about 8 to 10 feet at those locations. Sustained storm or high tide conditions and subsequent floods would have a substantial effect on groundwater levels within the site. We have reviewed Flood Insurance Rate Maps (FIRMs) published by the Federal Emergency Management Agency (FEMA) to establish the 100-year flood level for the project site. The 100-year flood level for the site is at Elev. +13 as shown on Sheets Nos. 5 and 6.

SEISMIC CONSIDERATIONS

In accordance with the 2006 International Building Code (adopted by New York State), seismic site classes B and C will applicable for seismic design of the structures depending on their location within the site. The potential for liquefaction in saturated granular soils can be estimated on the basis of blowcounts, SPT N-values, obtained during the boring investigation. Based on our review of the preliminary borings we anticipate that liquefaction will not need to be considered in the design.

FOUNDATION RECOMMENDATIONS

The project borings except for Boring B-9A encountered less than 10 feet of fill deposits. Hence, shallow spread footings bearing on natural sand deposits, decomposed rock or bedrock should be considered. After elevations of the buildings are established, the shallow footing option will need to investigated. Footings will need to extend through the fill to reach suitable, natural bearing materials. The bearing capacities of the foundation subgrade materials will range from 3 tons per square foot (tsf) on the sand strata to 20 tsf on sound bedrock.
If deepening of the footings by more than several feet is required or where footings would require significant excavation below the groundwater table, steel piles may need to be used. Steel pipe piles filled with concrete and steel H-piles should be considered. The piles would be relatively short and the pile capacity would be mainly obtained from end-bearing. Timber piles will likely not be suitable as they could get damaged during pile driving and due to their low lateral load capacities.

The allowable capacity of the steel piles will depend on the pile type selected but should not exceed 120 tons. Steel piles may be subject to corrosion when exposed to oxygenated water levels or when exposed to an aggressive environment. We recommend that a portion of the pile steel be neglected in its structural design or that the piles be coated with a corrosion prohibiting material. Load testing will be required. As noted above, the piles will be relatively short due to shallow bearing materials. Where piles will be shorter than about 10 feet, the lateral capacity of the foundation system will need to be analyzed and the pile caps may need to be tied together.

Please do not hesitate to contact us if you have any questions on the content of this report or the subsurface investigation performed.

Very truly yours,

MUESER RUTLEDGE CONSULTING ENGINEERS

### Remarks:
- **DR:** Hard drilling from 10.5' to 11'.  
  - 3" Coring time in 3 minutes per foot.  
  - 2" 1C: Recovered only 1" hard broken rock core pieces.  
  - Loss of wash water from 14' to 16'.

### Other:
- **WR:** Hard drilling at 22'.  
  - 2" Coring time in 2 minutes per foot.

### End:
- **R:** 32' End of Boring at 32'.

---

APPENDIX A - Laboratory Results

APPENDIX B - Disposal Certificates
1.0 INTRODUCTION

Ira D. Conklin & Sons, Inc. of Newburgh, New York (IDC), was contracted by The City of New Rochelle to conduct an underground storage tank (UST) closure report at the Department of Public Works Property located on North Main Street in New Rochelle, New York (Figure 1). The site is utilized as a municipal yard.

The objectives of this UST closure are to identify and characterize any contamination that may exist in soil and/or groundwater in the vicinity of the former underground storage tank. This assessment summarizes all site characterization activities that were conducted at the above referenced location. This report does not address any additional environmental concerns that may be associated with the site. The activities conducted at the site were performed in accordance with all local, state and federal regulations.
2.0 SCOPE OF WORK

In order to meet the objectives previously laid out, IDC has conducted a site assessment in the vicinity of the UST and associated piping, obtained soil samples from within the excavation of the tank and reviewed soil and/or groundwater laboratory analysis. Based on these findings a UST closure report characterizing the site has been generated. The scope of work necessary for IDC to adequately meet these objectives included the following:

- Excavation and disposal of one (1) 2,500 gallon waste oil UST.
- Scanning of the soil with a Photoionization detector (PID) to determine volatile organic vapor levels.
- Collection of post-excavation soil samples from the UST excavation for laboratory analysis utilizing EPA Method 8260 (volatile organic compounds - VOC), EPA Method 8270 (semi-volatile organic compounds – SVOC), and total RCRA Metals.
- Compilation/analysis of the site data and the preparation of a UST Closure Report.

The subsequent sections detail the UST removal and investigative findings.
3.0 BACKGROUND SITE INFORMATION

3.1 Site Identification

PBS # 3-600405
Spill # none associated with this tank removal
Tank # NA

3.2 Site Location

The site is located in New Rochelle, New York. The site is situated on North Main Street (Figure 1). A street address for the site is 224 North Main Street, New Rochelle, Westchester County, New York.

The site structures present include; (1) one building that is utilized as the Department of Public Works garage and offices; and several small outbuildings and pole barns for storage (Figure 2).

The area of concern for this assessment is limited to the area immediately surrounding the storage tank (Figure 2). In the past, the tank had been used to store waste oil. The site is currently occupied. Previous uses of the site were unavailable.

3.3 Area Land Use

Land use in the vicinity of the site consists primarily of commercial development.

3.4 Receptor Survey

The site is serviced by municipal water and sewer. The site is located on the Long Island Sound shoreline.
4.0 SITE ACTIVITIES

Site activities completed include the excavation and removal of one (1) 2,500 gallon waste oil UST, the screening of soils with a PID meter, sampling of the soil and analysis of the soil by a New York State Department of Health (NYSDOH) certified laboratory. The procedure and findings of these activities are outlined below.

4.1 UST Removal Operations

In April 2002, IDC was contracted by The City of New Rochelle to conduct a UST closure report on the removal of the above-mentioned UST and to generate a report based on the findings. Spill number 00-10419 was assigned to the site upon receipt of the soil analytical results. Several semi-volatile compounds were detected within the walls and bottom of the excavation. The following details these procedures.

4.1.1 Excavation

IDC personnel conducted the removal of the 2,500-gallon waste oil UST on April 23, 2002. The UST was pumped out to remove any remaining product before excavation commenced. The soils above and surrounding the UST was excavated until the top of the tank was encountered at approximately (4) four feet below grade surface. Excavation activities continued until there was enough space around the tank to facilitate removal without damage.

Once the tank was lifted from the subsurface, it was placed in a secure area for final inspection and cleaning. The tank was then rendered useless by cutting a window on the
end of the tank. The distribution and vent lines were also cleaned and transported in the same manner.

The soils within the excavation were scanned with a PID meter for total organic vapor concentration during tank removal operations. IDC did not detect any elevated PID readings during tank removal operations. The following readings were observed during the final soil screening analysis:

<table>
<thead>
<tr>
<th>Sample Location</th>
<th>Field Screening Results (ppm)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Excavation Walls</td>
<td>ND</td>
</tr>
<tr>
<td>Excavation Floor</td>
<td>ND</td>
</tr>
</tbody>
</table>

Note: ND = nondetect

Groundwater and bedrock were not encountered during the excavation procedures. The soils within the excavation were comprised of backfill materials, sandy loam and rock. The UST was strapped to a concrete pad in the bottom of the excavation.

After final cleaning, the tank was visually inspected. The UST was constructed of single wall bare steel. The condition of the tank was as follows:

<table>
<thead>
<tr>
<th>Tank</th>
<th>Condition</th>
</tr>
</thead>
<tbody>
<tr>
<td>2,500 gallon waste oil UST - SWS</td>
<td>Poor condition – pitting and corrosion present; no penetrations observed.</td>
</tr>
</tbody>
</table>
5.0 SAMPLING AND ANALYTICAL RESULTS

5.1 Sampling Procedures

5.1.1 Soil Sampling

Soil sampling at the site was conducted in accordance with NYSDEC Guidance Document “SPOTS 14”. IDC collected one (1) composite post-excavation soil sample from the walls of the excavation. All samples obtained from the excavation walls were collected 1/3 from the bottom of the excavation. IDC collected one (1) grab soil sample from the bottom of the excavation, from below the edge of the concrete pad. IDC technicians utilized latex gloves while collecting the soil sample and immediately placed the sample in a cooler for preservation, at 4 degrees Celsius, and delivery to York Laboratories located in Stamford, Connecticut (NYSDOH certified laboratory). The soil samples were analyzed for Volatile Organic Compounds by EPA Method 8260, Semi-Volatile Organic Compounds by EPA Method 8270, and Total RCRA Metals, as laid in the Spill Technology and Remediation Series (STARS) Memo #1 (Petroleum-Contaminated Soil Guidance Policy), dated August 1992 and prepared by the New York State Department of Environmental Conservation (NYSDEC) Division of Spill Management. The samples were identified as follows on the laboratory data sheets:

<table>
<thead>
<tr>

<td>3754 / Walls</td>
<td>Composite sample from excavation walls</td>
</tr>
</tbody>
</table>

5.1.2 Groundwater Sampling

Groundwater was not encountered during the excavation procedures.
5.2 Post-Excavation Sample Analytical Results

5.2.1 Soil Sample

The soil samples from within the excavation shows that the remaining soil meets the NYSDEC TAGM #4046 allowable soil concentrations. The following summarizes the findings of the soil analytical results from the samples collected from the excavation areas. The laboratory data sheets and chain of custody documentation can be found in Appendix A.

5.2.1.1 Excavation Floor

No VOC’s were detected within the bottom of the excavation. Ten (10) SVOC’s were detected within the soil sample obtained from the bottom of the excavation. Four (4) of the SVOC compounds detected slightly exceed NYSDEC TAGM #4046 allowable soil concentrations. The analytical results are detailed in the following table.
<table>

5.2.1.2 Excavation Walls

Four (4) VOC's were detected within the soil sample obtained from the walls of the excavation. None of the VOC's detected exceed NYSDEC TAGM #4046 allowable soil concentrations. Eleven (11) SVOC's were detected within the soil sample collected from the walls of the excavation. Four (4) of the SVOC's detected slightly exceed NYSDEC TAGM #4046 allowable soil concentrations. The analytical results are detailed in the following charts.

### 5.2.2 Groundwater Sample

Groundwater was not encountered during the excavation procedures, but is estimated to be approximately 15 feet below grade dependent upon tidal fluctuations.
6.0 CONCLUSIONS

6.1 Summary

The following summarizes the findings of the site assessment, UST removal and soil analytical results.

- One (1) 2,500-gallon waste oil UST was removed from the property.
- Final soil screening and laboratory analysis did detect slightly elevated levels of semi-volatile organic compounds within the walls and UST excavation.

6.2 Recommendations

Based on observations during the UST removal activities and low levels detected in the analytical results, IDC recommends that a passive course of remediation utilizing natural attenuation be utilized. The necessity for further action would solely be at the discretion of the Westchester County Department of Health.
7.0 REGULATORY NOTIFICATION

As required a copy of this report will be forwarded to the regional office of the Westchester County Department of Health and the New York State Department of Environmental Conservation for their review. The necessity for further remedial action will be at the discretion of the WCHD.
8.0 DISCLAIMER/LIMITATION OF DAMAGES

This report is based on a limited number of invasive samples and analyses and pertains only to the scope of work area. Any other environmental conditions that may be present at the site are excluded from this report. The conclusions presented in this report are based only on the observations made during this investigation and data provided by others. Conditions may vary significantly with time, particularly with respect to groundwater elevations and quality. Should additional data become available, this data may alter conclusions presented or extrapolated from this report. Therefore, the conclusions and recommendations set forth herein are applicable only to the facts and conditions described at the time of this report.

In performing its services, IDC of Newburgh, New York uses that degree of care and skill exercised under similar conditions. The standard of care shall be judged exclusively as of the time these services are rendered and not according to later standards. IDCs findings and conclusions must be considered not as scientific certainties, but rather as opinions concerning the significance of the data available. Specifically, IDC does not and cannot represent that the site contains no hazardous materials, oil, or other latent condition beyond that observed. IDC makes no express or implied warranty beyond its conformance to these standards.

IDC shall not be responsible for conditions or consequences arising from relevant facts that were concealed, withheld or not fully disclosed. IDC believes that all information contained in this report is factual, but no guarantee is made or implied. IDC shall not be responsible for any loss, damage or liability arising from any negligence of others in the interpretation or use of any results, report, or communication.
The data, information, opinions, recommendations, and conclusions contained in this site assessment report are intended for the sole and exclusive use of the client. Any use of or reliance upon this report or its content by any other party is prohibited by IDC, unless such use or reliance is expressly authorized in writing by IDC. IDC assumes no responsibility or liability to any party for any damage, cost, expense, or liability incurred by such party as a result of unauthorized use of or reliance upon the report, and in any event such liability of IDC shall be no greater in aggregate than the lesser of the compensation received for this report or the amount covered by IDC insurance policy.

Newburgh, NY 12550
Attention: Jackie Patt

Report Date: 4/30/2002
Re: Client Project ID: New Rochelle DPW
York Project No.: 02040656
Purpose and Results

This report contains the analytical data for the sample(s) identified on the attached chain-of-custody received in our laboratory on 04/25/02. The project was identified as your project "New Rochelle DPW".

The analyses were conducted utilizing appropriate EPA, Standard Methods, and ASTM methods as detailed in the data summary tables.

All samples were received in proper condition meeting the NELAC acceptance requirements for environmental samples except those indicated under the Notes section of this report.

All the analyses met the method and laboratory standard operating procedure requirements except as indicated under the Notes section of this report, or as indicated by any data flags, the meaning of which is explained in the attachment to this report, if applicable.

The results of the analyses, which are all reported on an as-received basis unless otherwise noted, are summarized in the following table(s)

Notes for York Project No. 02040656

1. The MDL (Minimum Detectable Limit) reported is adjusted for any dilution necessary due to the levels of target and/or non-target analytes and matrix interference.
2. Samples are retained for a period of thirty days after submittal of report, unless other arrangements are made.
3. York's liability for the above data is limited to the dollar value paid to York for the referenced project.
4. This report shall not be reproduced without the written approval of York Analytical Laboratories, Inc.
5. All samples were received in proper condition for analysis with proper documentation.
6. All analyses conducted met method or Laboratory SOP requirements.
7. It is noted that no analyses reported herein were subcontracted to another laboratory.

1.0 INTRODUCTION

Groundwater & Environmental Services, Inc. (GES) conducted remedial feasibility testing at the above-referenced facility on November 30, 2004 (Figure 1). The wells used for the tests were MW-2, MW-3, MW-4, OB-1, OB-2, MW-1, SP-1 and SP-2. Well locations are shown on the attached site map (Figure 2). Soil Vapor Extraction (SVE) tests were performed on MW-2, MW-3 and MW-1. Additionally, an air sparge/ SVE test was performed on SP-1/MW-2 and SP-2/MW-1. GES conducted these testing activities to determine the most appropriate remedial technology in order to effectively remediate hydrocarbon-impacted soil and groundwater at the facility.

2.0 FEASIBILITY TEST METHODOLOGY

Remedial feasibility test activities were performed using GES’ Data Acquisition and Processing Laboratory (DAPL). The DAPL unit is a self-contained platform that provides computerized on-site real-time data acquisition and processing evaluation. The DAPL unit is fully equipped with pumps, sensors, and hardware needed to perform soil vapor extraction, total phase extraction, air sparging, and various groundwater and product recovery tests. Onboard sensors monitor and continuously log all system operating conditions and field responses, including vacuum/pressure responses, vapor and liquid flow rates, and groundwater levels. The onboard computer manages and integrates the incoming data and performs real-time calculations and analyses to allow for immediate evaluation of test conditions. This allows for flexibility in customizing the test to site conditions.

The feasibility testing activities were conducted at the following locations during the event:

- a SVE test at monitoring well MW-2;
- an AS/SVE test at monitoring well MW-2 and air sparge well SP-1;
- a SVE test at monitoring well MW-3;
- a SVE test at monitoring well MW-1;
- an AS/SVE test at monitoring well MW-1 and air sparge well SP-2;

Prior to starting feasibility test activities, static measurements of groundwater elevations were recorded at each monitoring well. These measurements were recorded to provide baseline data to compare subsequent readings. Pre-test groundwater elevations were recorded at all extraction and observation wells utilizing an interface probe. These measurements and well construction details are shown in Table 1.

Static soil pressure conditions (positive or negative) may exist due to natural pressures that occur in the soil pore space relative to atmospheric conditions. During each SVE test, the resulting induced pressure or vacuum was regularly measured at various surrounding observation wells. The soil pressure readings were measured using transducers which were installed in each observation well.

During SVE testing, the influent vapor stream was periodically screened for volatile organic compounds using an organic vapor monitor. Vapor samples were collected for laboratory analyses to determine hydrocarbon concentrations and recovery rates at various extraction wells and during different test scenarios. The samples were collected following appropriate quality assurance/quality control protocols and were submitted under proper chain-of-custody procedures to Spectrum Laboratories of Agawam, Massachusetts (air samples). Vapor samples were analyzed for benzene, toluene, ethyl benzene, and total
xlyenes (BTEX), methyl tert-butyl ether (MTBE), and total petroleum hydrocarbons (C₃-C₁₂). Laboratory analytical reports are presented in Appendix A.

Prior to discharge, extracted soil vapors were treated with 400 pounds of granulated activated carbon contained in two drums.

3.0 FEASIBILITY TESTING

The main purpose of the test was to verify the effectiveness of the proposed remedial action technologies on the hydrocarbon impacted soil and groundwater at this site and to collect the data necessary to prepare the final system design specifications. For testing purposes, the site was divided into two areas, one located in front of the pump islands, and the other near the oil water separator (Figure 2). To assess and monitor these areas, GES installed additional observation wells and sparge wells. Sparge well SP-1 and monitoring wells OB-1 and OB-2 were installed on November 22, 2004, and sparge well SP-2 was installed on November 23, 2004 (Figure 2). Monitoring well logs are presented in Appendix B.

3.1 FEASIBILITY TESTING AT MONITORING WELL MW-2

3.1.1 SVE Testing

During SVE testing activities at monitoring well MW-2, vacuums of 15 inches of water (i.w.), and 24 i.w. were applied in successive steps, yielding average vapor flow rates of 72 standard cubic feet per minute (scfm) and 28 scfm, respectively. Under the maximum attainable vacuum (24 i.w.), the estimated radius-of-influence (ROI) at monitoring well MW-2 extends approximately 52 feet, assuming 0.1 i.w. is the minimal effective vacuum influence. The highest vacuum influence was observed at a distance of 69.0 feet (0.06 i.w. at monitoring point MW-4). The BTEX, MTBE and total petroleum hydrocarbon (C₃-C₁₂) recovery rates under these conditions were estimated to be 0.686 pounds per day (lb/day), 0.092 lb/day and 66.9 lb/day, respectively. See Figure 3 for the ROI graph for monitoring well MW-2. Hydrocarbon recovery rates are presented in Table 2.

3.1.2 AS/SVE Testing

During the SVE test at monitoring well MW-2, an air sparge test was initiated at SP-1. Initially, the air sparge pressure was set at 6.73 pounds per square inch (psi) and the airflow rate was observed to be 4 scfm. An initial pressure requirement is typically needed to overcome the static head of water above the well screen and any possible fouling of the well screen. At sparge pressures of 11.4 psi and 12.7 psi, the observed flow rates were 7 scfm and 10 scfm, respectively. At an air sparge flow rate of 7 scfm, and the maximum attainable vacuum (22 i.w.) at monitoring well MW-2, the estimated ROI extends approximately 48 feet. The highest vacuum influence was observed at a distance of 69 feet (0.07 i.w. at monitoring point MW-4). See Figure 4 for the ROI graph for the AS/SVE test of monitoring wells SP-1 and OS-3.

The vapor sample analytical data did not indicate any significant change in the BTEX, MTBE and total volatile hydrocarbon (C₃-C₁₂) concentrations during the combined AS/SVE test. With an air sparge flow rate of 7 scfm, recovery rates remained relatively unchanged at 0.791 lb/day, 0.105 lb/day and 66.9 lb/day, for BTEX, MTBE and total petroleum hydrocarbons (C₃-C₁₂), respectively. The results of the SVE and AS/SVE tests are presented in Table 2.
3.2 FEASIBILITY TESTING AT MONITORING WELL MW-3

3.2.1 SVE Testing

During SVE test activities at monitoring well MW-3, a vacuum of 56 i.w. was applied, yielding an average vapor flow rate of 44 scfm. Under this maximum attainable vacuum (56 i.w.), the estimated ROI at monitoring well MW-3 extends approximately 60 feet, assuming 0.1 i.w. is the minimal effective vacuum influence. The highest vacuum influence was observed at a distance of 98.6 feet (0.02 i.w. at monitoring well MW-2). See Figure 5 for the ROI graph for monitoring well MW-3.

The BTEX, MTBE and total petroleum hydrocarbon (C_{3} - C_{12}) recovery rates under these conditions were estimated to be 1.59 lb/day, 0.04 lb/day and 74.4 lb/day, respectively. Hydrocarbon recovery rates are presented in Table 2.

3.3 FEASIBILITY TESTING AT MONITORING WELL MW-1

3.3.1 SVE Testing

During SVE test activities at monitoring well MW-1, vacuums of 30 i.w. and 60 i.w. were applied, yielding average vapor flow rates of 30 scfm and 27 scfm, respectively. Under these conditions, no significant vacuum response was observed in monitoring wells, OB-1 and OB-2. The BTEX, MTBE and total petroleum hydrocarbon (C_{3} - C_{12}) recovery rates were estimated to be 0.001 lb/day, 0.02 lb/day and 1.326 lb/day, respectively.

3.3.2 AS/SVE Testing

During the SVE test at monitoring well MW-1, an air sparge test was initiated at SP-2. Initially, the air sparge pressure was set at 6.5 psi and the air flow rate was observed to be 5 scfm. An initial pressure requirement is typically needed to overcome the static head of water above the well screen and any possible fouling of the well screen. At a sparge pressure of 13.8 psi, the observed flow rate was 10 scfm. At these flow rates and a vacuum of 20 i.w. at monitoring well MW-1, no significant pressure response was observed in monitoring wells OB-1 and OB-2. The results of the SVE and AS/SVE tests are presented in Table 2.

4.0 FEASIBILITY TESTING RESULTS

Pilot testing activities indicated that relatively permeable soil conditions exist in the vadose zone at the subject property. Vapor flow rates and corresponding vacuums during SVE tests ranged from 19 to 83 scfm. Vapor flow rates during SVE testing at MW-1 were lower than those observed at MW-2 (Figure 6). This is likely due to the fact that the screen zone for MW-1 is 2 feet shorter than the screen zone for MW-2 (Table 1). Since the screen zone begins at 5' below ground surface and depth to water was measured as 6.5' below ground surface, there was only approximately 1.5' of exposed screen in MW-1. This restricts the amount of air which can be pulled into the well and also requires a higher applied vacuum. See Figure 6 for the vacuum versus flow graph for monitoring wells MW-1 and MW-2.
Vacuum influence levels were measured to be moderate at monitoring well MW-4 and low at monitoring well MW-3 during the entire SVE test at MW-2. There was no change in vacuum response during the air sparge test at MW-2 and SP-1.

Laboratory analysis of the air bag sample collected during the test indicated a relatively high hydrocarbon recovery rate. However, no change in the recovery rate was observed during the air sparge test performed at MW-2 and SP-1. The analytical laboratory data is summarized in Table 2. Laboratory analytical results are presented in Appendix A.

The SVE test at MW-3 indicated minimal vacuum influence at monitoring well MW-2 and no influence at monitoring well MW-4. Laboratory analysis of the air bag sample indicated relatively high hydrocarbon recovery rates. The analytical laboratory data is summarized in Table 2. Laboratory analytical results are presented in Appendix A.

While the drawdown curve for SVE/AS test on MW-2 shows upwelling of water in all the wells after the applied sparge pressure (Figure 7), no pressure response was noted at any of the observation wells (MW-3 located 69 feet away, and MW-4 located 98 feet away).

The SVE test at MW-1 did not yield vacuum response at observation wells OB-1 and OB-2. The combined AS/SVE test also did not yield any vacuum response. Hydrocarbon recovery rates were very low. The analytical laboratory data is summarized in Table 2. Although the drawdown curve (Figure 8) indicates significant upwelling after the air sparge test (1.49 ft at OB-1 and 0.12 ft at OB-2), pressure response was not observed.

5.0 CONCLUSION

SVE appears to be moderately effective in the vicinity of MW-2. However, the addition of air sparging does not enhance hydrocarbon recovery rates at MW-2. Since this area is unpaved and the water table is relatively shallow (8.7 feet), the lack of response during air sparge testing may be due short-circuiting of air to the ground surface. Air sparging appears to influence upwelling in the vicinity of the vapor recovery well, MW-2. The observed upwelling is likely a result of displacement of water due to the applied positive pressure in the saturated zone during the air sparge test.

SVE appears to be ineffective in the area of MW-1. Significant upwelling of water was also observed at this location during the AS/SVE test, again likely due to displacement of water as a result of the applied sparge pressure. The reduced exposed screen length at extraction well MW-1 and the upwelling of water resulted in a reduction of the air flow rate/vacuum ratio, which suggests that this well is not suitable for vapor extraction under the current site conditions. The poor results obtained during both the SVE and SVE/AS tests in this area may be a result of short-circuiting of air in the subsurface due to the presence of preferential flow paths that may exist from existing and former subsurface installations in the test location (oil water separator, former tanks, and associated piping runs).

Based on the site characterization and feasibility testing, GES recommends implementation of a SVE system for the areas around MW-2 and MW-3 (Figure 2). This system would address the vadose zone impacts above the water table, but would have limited influence in the saturated zone. Additional remedial technologies may need to be evaluated to address the groundwater impacts.

*This laboratory report is not valid without an authorized signature on the cover page.*

*Reportable Detection Limit  BRL = Below Reporting Limit*
**Tests and Definitions**

- **L** Below Reporting Limit - Analyte NOT DETECTED at or above the reporting limit
  
  Sample results reported on a dry weight basis
  
  Not Reported

- **D** Relative Percent Difference

A plus sign (+) in the Method Reference column indicates the method is not accredited by NELAC.

**Laboratory Control Sample (LCS):** A known matrix spiked with compound(s) representative of the target analytes, which is used to document laboratory performance.

**Duplicate:** An intra-laboratory split sample which is used to document the precision of a method in a given sample matrix.

**Spiked:** An aliquot of a sample spiked with a known concentration of target analyte(s). The spiking occurs prior to sample preparation and analysis. A matrix spike is used to document the bias of a method in a given sample matrix.

**Blank:** An analyte-free matrix to which all reagents are added in the same volumes or proportions as used in sample spiking. The method blank should be carried through the complete sample preparation and analytical procedure. The method blank is used to document contamination resulting from the analytical process.

**Detection Limit (MDL):** The minimum concentration of a substance that can be measured and reported with 99% confidence that the analyte concentration is greater than zero and is determined from analysis of a sample in a given matrix type that was spiked with the analyte.

**Reportable Detection Limit (RDL):** The lowest concentration that can be reliably achieved within specified limits of precision and bias during routine laboratory operating conditions. For many analytes the RDL analyte concentration is selected as the lowest zero standard in the calibration curve. While the RDL is approximately 5 to 10 times the MDL, the RDL for each sample takes account the sample volume/weight, extract/digestate volume, cleanup procedures and, if applicable, dry weight correction. Multiple RDLs are highly matrix-dependent.

**Surrogate:** An organic compound which is similar to the target analyte(s) in chemical composition and behavior in the analytical process, but which is not normally found in environmental samples. These compounds are spiked into all blanks, standards, and samples prior to analysis. Percent recoveries are calculated for each surrogate.

DATA REPORTING QUALIFIERS- ORGANIC

For reporting results, the following "Results Qualifiers" are used:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>U</td>
<td>Indicates the compound was analyzed for but was not detected. Report the minimum detection limit for the sample with the U, i.e. &quot;10 U&quot;. This is not necessarily the instrument detection limit attainable for this particular sample based on any concentration or dilution that may have been required.</td>
</tr>
</tbody>
</table>
| J     | Indicates an estimated value. This flag is used:  
1) When estimating a concentration for a tentatively identified compound (library search hits, where a 1:1 response is assumed.)  
2) When the mass spectral data indicated the identification, however the result was less than the specified detection limit greater than zero. If the detection limit was 10ug/L and a concentration of 3 ug/L was calculated report as 3 J. This is flag is used when similar situation arise on any organic parameter i.e. Pest, PCB and others. |
| B     | Indicates the analyte was found in the blank as well as the sample report as "12 B". |
| E     | Indicates the analyte 's concentration exceeds the calibrated range of the instrument for that specific analysis. |
| D     | This flag identifies all compounds identified in an analysis at a secondary dilution factor. |
| P     | This flag is used for Pesticide/PCB target analyte when there is >25% difference for detected concentrations between the two GC columns. The lower of the two values is reported on Form 1 and flagged with a "P". |
| N     | This flag indicates presumptive evidence of a compound. This is only used for tentatively identified compounds (TICs), where the identification is based on a mass spectral library search. It applies to all TIC results. For generic characterization of a TIC, such as chlorinated hydrocarbon, the flag is not used. |
DATA REPORTING QUALIFIERS- INORGANIC

For reporting results, the following “Results Qualifiers” are used:

J  If the reported value was obtained from a reading that was less than the Contract Required Detection Limit (CRDL), but greater than or equal to the Instrument Detection Limit (IDL).

U  If the analyte was analyzed for, but not detected.

E  The reported value is estimated because of the presence of interference.

M  Duplicate injection precision not met.

N  Spiked sample recovery not within control limits.

S  The reported value was determined by the Method of Standard Addition (MSA).

W  Post-digestion spike for Furnace AA analysis is out of control limits (85-115%), while absorbance is less than 50% of spike absorbance.

*  Duplicate analysis not within control limits.

+  Correlation coefficient for the MSA is less than 0.995.

*** Entering “S”, “W” or “+” is mutually exclusive. NO combination of these qualifiers can appear in the same field for an analyte.

D  The reported value is from a secondary analysis with a dilution factor. The original analysis exceeded the calibration range.

M  Method qualifiers
   “P’” for ICP instrument
   “A” for Flame AA
   “PM” for ICP when Microwave Digestion is used
   “AM” for flame AA when Microwave Digestion is used
   “FM” for furnace AA when Microwave Digestion is used
   “CV” for Manual Cold Vapor AA
   “AV” for automated Cold Vapor AA
   “CA” for MIDI-Distillation Spectrophotometric
   “AS’” for Semi-Automated Spectrophotometric
   “C” for Manual Spectrophotometric
   “T” for Titrimetric
   “NR” for analyte not required to be analyzed

OR  Indicates the analyte’s concentration exceeds the calibrated range of the instrument for that specific analysis.

QA Control # A3040282
APPENDIX A

QA REVIEW GENERAL DOCUMENTATION

Project #: X 3102

For thorough review, the report must have the following:

GENERAL:
Are all original paperwork present (chain of custody, record of communication, airbill, sample management lab chronicle, login page)
Check chain-of-custody for proper relinquish/return of samples
Is the chain of custody signed and complete
Check internal chain-of-custody for proper relinquish/return of samples/sample extracts
Collect information for each project id from server. Were all requirements followed

COVER PAGE:
Do numbers of samples correspond to the number of samples in the Chain of Custody and on login page
Do lab numbers and client Ids on cover page agree with the Chain of Custody

CHAIN OF CUSTODY:
Do requested analyses on Chain of Custody agree with form I results
Do requested analyses on Chain of Custody agree with the log-in page
Were the correct method log-in for analysis according to the Analytical Request and Chain of Custody
Were the samples received within hold time
Were any problems found with the samples at arrival recorded in the Sample Management Laboratory Chronicle

ANALYTICAL:
Was method requirement followed?
Was client requirement followed?
Does the case narrative summarize all QC failure?

1st Level QA Review Signature: Zb. Rohan Date: 06/14/06

2nd Level QA Review Signature: Uga Dudley Date: 6/14/06

WORK ASSIGNMENT NUMBER: 139-SIBZ-02ZZ  
BROWNFIELDS SITE INSPECTIONS - NEW ROCHELLE CITY ARMORY PROPERTY  
REVISED SITE-SPECIFIC FIELD SAMPLING PLAN

21 November 2003  
RAC II-2003-223

Dear Ms. Devine:

Foster Wheeler Environmental Corporation (Foster Wheeler Environmental) is pleased to provide this Revised Site-Specific Brownfields Field Sampling Plan for the New Rochelle City Armory property (site). The sampling approach presented herein was developed based upon our review of site background information, observations made during the 28 March 2003 site reconnaissance, and comments provided by EPA during our 12 November 2003 conference call. A summary of the findings of the background information was provided in our March 2003 Draft Background Memorandum.

The attached table indicates areas to be sampled and the rationale supporting the sample locations based upon the findings during the site reconnaissance as well as information presented in the Draft Background Memorandum. Figure 1 presents the proposed sampling locations. As directed by EPA in our 12 November conference call, groundwater sampling has been eliminated.

Soil borings will be performed using a direct push (i.e., GeoProbe®) drilling rig in accordance with protocols specified in the Generic Field Sampling Plan. If soil sample locations are situated below asphalt or concrete, these materials will be cored using the appropriate coring equipment based upon the material encountered to allow access to the subsurface soils as necessary. As directed by EPA in our 12 November conference call, at each boring location, one soil sample (two were proposed) will be collected, biased towards evidence of contamination (i.e., staining, odors, etc.). If no contamination is evident during the screening process, one soil sample will be collected directly above the soil/groundwater interface. Borings will terminate at the groundwater table, and each boring will be backfilled with comparable materials at completion.

If you should have any questions regarding this submittal or require additional information, please do not hesitate to contact me at (973) 630-8594.

Sincerely,

Robert Chozick, Ph.D., P.E.  
RAC II Project Manager

WORK ASSIGNMENT NUMBER: 139-SIBZ-02ZZ  
BROWNFIELDS SITE INSPECTIONS – MANCUSO MARINA PROPERTY  
REVISED SITE-SPECIFIC FIELD SAMPLING PLAN

Dear Ms. Devine:

Foster Wheeler Environmental Corporation (Foster Wheeler Environmental) is pleased to provide this Revised Site-Specific Brownfields Field Sampling Plan for the Mancuso Marina property (site). The sampling approach presented herein was developed based upon our review of site background information, observations made during the 27 March 2003 site reconnaissance, and comments provided by EPA during our 12 November 2003 conference call. A summary of the findings of the background information was provided in our March 2003 Draft Background Memorandum.

The attached table indicates areas to be sampled and the rationale supporting the sample locations based upon the findings during the site reconnaissance as well as information presented in the Draft Background Memorandum. Figure 1 presents the proposed sampling locations. As directed by EPA in our 12 November conference call, groundwater sampling has been eliminated.

Soil borings will be performed using a direct push (i.e., GeoProbe®) drilling rig in accordance with protocols specified in the Generic Field Sampling Plan. If soil sample locations are situated below asphalt or concrete, these materials will be cored using the appropriate coring equipment based upon the material encountered to allow access to the subsurface soils as necessary. As directed by EPA in our 12 November conference call, at each boring location, one soil sample (two were proposed) will be collected, biased towards evidence of contamination (i.e., staining, odors, etc.). If no contamination is evident during the screening process, one soil sample will be collected directly above the soil/groundwater interface. Borings will terminate at the groundwater table, and each boring will be backfilled with comparable materials at completion.

If you should have any questions regarding this submittal or require additional information, please do not hesitate to contact me at (973) 630-8594.

Sincerely,

Robert Chozick, Ph.D., P.E.  
RAC II Project Manager

BROWNFIELDS SITE INSPECTIONS  
BACKGROUND MEMORANDA FOR NEW ROCHELLE SITES  

Dear Ms. Devine:  

Foster Wheeler Environmental Corporation (Foster Wheeler Environmental) is pleased to provide two (2) copies of the Background Memoranda for the following sites:  

1. New Rochelle City Yard  
2. New Rochelle City Armory  
3. Mancuso Marina  

Per your direction, Foster Wheeler Environmental has forwarded one copy of each of the Background Memoranda to Mr. Lewis Wendell, Deputy Commissioner, Department of Development, New Rochelle.  

If you should have any questions or require additional information, please do not hesitate to contact me at (973) 630-8594.  

Sincerely,

EXECUTIVE SUMMARY

Foster Wheeler Environmental Corporation (Foster Wheeler Environmental) is submitting this Brownfields Site Background Memorandum for the New Rochelle City Armory to the United States Environmental Protection Agency (EPA), in response to EPA Work Assignment Number 039-SISI-02ZZ issued under EPA RAC II Contract Number 68-W-98-214. This report is based upon, and is consistent with EPA guidance.

The City Armory property, currently owned by the City of New Rochelle, is located at 270 Main Street, New Rochelle, New York and is identified as Block 84, Lot 22. The northwestern portion of the property is developed and occupied by buildings, storage structures, parking and driveway areas. The southeastern portion of the property is predominantly undeveloped. The area is currently zoned M-1 and M-3, which are identified as light and heavy manufacturing, respectively. Mixed commercial properties including restaurants, delicatessens, car dealers, and small retail shops line Main Street in the vicinity of the property. Residential properties dominate the secondary streets.

The City Armory property is contiguous to Echo Bay of the Long Island Sound and is located within the Westchester County Designated Long Island Sound Critical Environmental Area. The topography of the property slopes gently to the southeast with elevations ranging from 0 to 30 feet above mean sea level (msl). Approximately 5 percent of the site occurs within the 100-year floodplain, approximately 10 percent within the 500-year floodplain, and the remaining 85 percent of subject property occurs within areas of minimal flooding. The site soils are identified as Urban land, where at least 60 percent of the land surface is covered with buildings or other structures. Estuarine non-vegetated wetlands are identified by the National Wetland Inventory (NWI) as occurring along the eastern and southern edges of the subject property.

Three well databases (Federal USGS, Federal FRDS Public Water Supply (PWS), and State Database) were searched by Environmental Data Resources, Inc. (EDR) for the occurrence of potable water wells within a one-mile radius of the property. Six Federal USGS wells and one Federal FRDS PWS well are located within one mile of the City Armory property. One of the Federal USGS wells was identified as unused. The primary uses of water for the remaining wells include commercial (three wells) and industrial (two wells). The PWS well currently has or had major violation(s) or enforcement actions. Information regarding the direction of groundwater flow was not provided by EDR.

Foster Wheeler Environmental’s background investigation identified the following areas of concern and associated recommendations:

- **Spills** – One spill (25 gallons of #2 fuel oil) was identified by EDR as occurring at the City Armory property. Most of the spill was contained in a diked area, but some of it reached a storm drain which led into Long Island Sound. It is recommended that supplemental information be reviewed regarding this spill, and if necessary, soil sampling be performed.
• **AST** – An AST is reported to be present at the facility. If stained areas are observed in the vicinity of the AST during the site inspection, soil sampling should be performed.

• **Fill Material** - According to the 1969 aerial photograph, the area adjacent to the eastern side of the dock located in the southeastern corner of the property was filled to increase the land mass. The origin of this fill material is not known. Therefore, sampling of the material is recommended to determine if any environmental impacts have resulted from the introduction of this material to the property.

• **New Rochelle City Yard** – Seven spills were identified at the adjacent New Rochelle City Yard property. It is recommended that groundwater samples be collected at the City Armory to evaluate potential impacts from the City Yard site.

• **Consolidated Edison Property** – A former Consolidated Edison substation was located on Echo Avenue between 0.125 and 0.25 mile to the southwest of the subject property at a higher elevation. Cleanup activities to remove PCB contaminated soil and sediment from the Consolidated Edison property, adjacent commercial and residential properties, and the Echo Bay tidal lands are almost complete. It is recommended that soil and sediment samples be collected from the southern portion of the City Armory property along Echo Bay and analyzed for PCBs.

• **Lead-based Paint and Asbestos Containing Building Material (ACBM)** – Due to the age of the buildings at the property, the possibility of the presence of lead-based paint and ACBM in the structures exists. If suspect material is observed during the site inspection, sampling of the material is recommended to be performed.

• **Drains** – If it is determined that floor drains are present within the facility’s structures, the discharge points should be determined and samples collected in the drain and at the discharge location, if possible.

• **Transformers** – If it is determined that transformer(s) are present at the property, and stained areas are observed in the vicinity of the transformer(s) during the site inspection, soil sampling should be performed in the stained areas to determine if any environmental impacts have resulted from the transformer(s).
1.0 INTRODUCTION

The City of New Rochelle, Westchester County, New York proposes to construct a mixed-use residential waterfront community on lands contiguous to Echo Bay. The project will expand across several City-owned properties including the New Rochelle City Armory. Usage of the proposed community will include approximately 336,300 square feet residential, 32,500 square feet commercial/office, and 24,000 square feet specialty retail. The proposed project will also improve public access to Echo Bay.

This Draft Brownfields Site Background Memorandum presents the findings of a background investigation of the 1.94-acre New Rochelle City Armory property (City Armory property). Foster Wheeler Environmental Corporation (Foster Wheeler Environmental) conducted this assessment in response to the United States Environmental Protection Agency (EPA) Work Assignment Number 039-SISI-02ZZ, issued under EPA RAC II Contract Number 68-W-98-214. This report is based upon, and is consistent with EPA guidance for completion of a Preliminary Site Assessment (PSA).

1.1 Objectives

The goal of the Brownfields Site Inspections (BSIs) being performed under this Work Assignment is to provide a detailed characterization of environmental conditions at Brownfields Sites that have redevelopment potential. The four primary objectives of the BSIs are:

- Determine the nature and extent of contamination on the site;
- Determine the risks posed by the contamination;
- Determine the potential remedial alternatives to minimize continued risks to human health and/or the environment; and,
- Estimate costs of identified cleanup options in the scope of site redevelopment.

The first phase of the BSI is a background investigation, which is the subject of this report. Foster Wheeler Environmental conducted a review of background information of the City Armory property in New Rochelle, New York in order to obtain information on environmental issues related to past and current use of the property to assist EPA in identifying the possibility of recognized environmental conditions.

1.2 Scope of Work

The following tasks were included in preparing the Brownfields Site Background Memorandum for the City Armory property:
Task 1: Evaluate Existing Data and Documents

In order to identify any existing environmental conditions at the property, and determine whether contamination has been previously documented for the property, Foster Wheeler Environmental performed an evaluation of existing, available files and documents. Foster Wheeler Environmental obtained and reviewed existing background information, including: Sanborn fire insurance maps, aerial photographs, United States Department of the Interior, Geological Survey (USGS) Topographic maps, United States Fish and Wildlife Service (USFWS) National Wetland Inventory (NWI) maps, New York State Department of Conservation (NYSDEC) wetlands maps, tidal wetlands maps, county soil survey, and Federal Emergency Management Agency (FEMA) Flood Insurance Rate Maps (FIRM). In addition, Freedom of Information Act (FOIA) letters were submitted to the relevant regulatory agencies requesting a review of all files pertaining to the City Armory property.

Task 2: Environmental Regulatory Database Search

Foster Wheeler Environmental obtained a commercially available database report of a search of Federal and State regulatory databases to determine the possible presence of hazardous substances or petroleum products at the property or within the proximity of the property.

Task 3: Conduct Select Interviews

Interviews were conducted with property owners and occupants of the site. As the property is owned and operated by the City of New Rochelle, interviews were limited to City personnel. Property visits or reconnaissance were not included in this phase of work; therefore, interviews were conducted with Planning Department and Department of Public Works (DPW) personnel at the City office and did not include property personnel. Pertinent files or contacts associated with the City Armory property were obtained during the interviews.

Task 4: Prepare Brownfields Site Background Memorandum

This Brownfields Site Background Memorandum summarizes general site characteristics, including current and historical site use, geology, hydrology, and the presence of surface water features. In addition, a summary of potential and/or known environmental concerns was documented and an inventory of water supply wells (public or private) within one mile of the subject property was compiled.

1.3 Special Terms and Conditions

Foster Wheeler Environmental's assessment represents a review of certain information relating to the property that was obtained by methods described above and did not include a site visit, sampling, or other monitoring activities at the property. While Foster Wheeler Environmental has used reasonable care to avoid reliance upon data and information that is inaccurate, Foster Wheeler Environmental is not able to verify the accuracy or completeness of all data and information available during the investigation and some of the conclusions would be different if the information upon which they are based is determined to be false, inaccurate, or incomplete. Foster Wheeler Environmental makes no
legal representations whatsoever concerning any matter, including, but not limited to, ownership of any property or the interpretation of any law. Foster Wheeler Environmental further disclaims any obligation to update the report for events taking place after the time during which the assessment was conducted.

1.4 Limiting Conditions

A site reconnaissance was not included in the scope of work for this portion of the project. Therefore, data pertinent to performing an accurate evaluation of the environmental conditions of the site (i.e. staining, material storage practices, presence of asbestos, lead-based paint, tanks and floor drains, and interviews with site personnel) are not included in this report. In addition, all data presented in the report is provided without the benefit of verifying the information in the field.
2.0 SITE DESCRIPTION

The information in this section was obtained from select interviews and a records review. A description of the interviews is contained in Section 4.0. A list of the documents reviewed during the preparation of this Brownfields Site Background Memorandum is provided in Section 6.0.

2.1 Site Location and Legal Description

The New Rochelle City Armory property is located at 270 Main Street in New Rochelle, Westchester County, New York and is listed as Section 1, Block 84, Lot 22 in the records of the Bureau of Buildings. The location of the site is shown on Figure 1, Site Location Plan.

2.2 Site and Vicinity Characteristics

The City Armory property lies between Main Street and Echo Bay of the Long Island Sound. The 1.94-acre property is bound by Main Street to the northwest, the New Rochelle City Yard to the northeast, Echo Bay to the southeast, and a commercial property to the southwest. The northwestern portion of the property is developed and occupied by buildings, storage structures, parking and driveway areas. The southeastern portion of the property is predominantly undeveloped. The area is currently zoned M-1 and M-3, which are identified as light and heavy manufacturing, respectively. Mixed commercial properties including restaurants, delicatessens, car dealers, and small retail shops line Main Street in the vicinity of the site. Residential properties dominate the secondary streets.

2.3 Site Improvements

Based on information provided during interviews with City personnel, the site is currently used as a storage facility for Habitat for Humanity (i.e., outside storage). According to a map provided by the City of New Rochelle, the following is a description of the on-site buildings:

- Naval Militia Armory – A two-story brick building of fireproof construction, 45 feet by 105 feet in size.
- Addition – A three-story brick building of fireproof construction, 20 feet by 40 feet in size.
- Addition – A two-story brick building of fireproof construction, 20 feet by 80 feet in size.
- Drill Shed – A one-story brick building, 80 feet by 120 feet in size.
2.4 Current Uses of the Property

As previously stated, the City Armory property is currently owned by the City of New Rochelle. Based on interviews with City personnel, the Armory property was acquired by the City of New Rochelle from the Naval Militia on 24 July 1997. The site buildings are currently empty. Habitat for Humanity stores building supplies on exterior laydown areas outside the buildings.

2.5 Past Uses of the Property

According to City personnel, the City Armory property was deeded to the Naval Militia in two parcels in 1930 and 1933. Prior to that time, the property was residential. According to Mr. Lewis Wendell, Deputy Commissioner, Department of Development, City of New Rochelle, the main building of the City Armory has been used by the City of New Rochelle Department of Public Works as a haunted house at Halloween, and as a storage area for supplies from the recovery activities after 11 September 2001.

2.6 Current and Past Uses of Adjoining Property

The subject property is bordered by Main Street to the northwest, the New Rochelle City Yard to the northeast, Echo Bay to the southeast, and a commercial property to the southwest. The New Rochelle City Yard houses the City of New Rochelle’s Department of Public Works. Structures on the property include six separate one-story structures of various construction materials and types. These buildings are used as a Carpentry Shop; Sewers & Drains, Streets and Highways, and Sanitation Building; Compost Building; Machinery/Car Storage; Repair Garage, and Bookmobile Storage Building.
3.0 RECORDS AND DATA REVIEW

3.1 Regulatory Agency Database Search

This section of the report is a compilation of Federal, State, and local environmental databases. This information is as current as the most recent updated database. However, due to the dynamic nature of environmental laws and data reporting, this information will change over time.

A search of available environmental records was performed by EDR, and a report was issued to Foster Wheeler Environmental on 24 February 2003. Foster Wheeler Environmental did not participate in the research or compilation of the records report. A copy of this report is provided in Appendix A. Databases reviewed for the subject and surrounding properties, and the associated search radii, include:

- **NPL - National Priority List.** The NPL is a subset of the CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. This database was last issued on 24 October 2002, and the search distance was one mile.

- **Proposed NPL – Proposed National Priority List Sites.** The source of this database is the EPA. The latest version of this database was issued on 24 October 2002, and the search distance was one mile.

- **CERCLIS - Comprehensive Environmental Response, Compensation, and Liability Information System.** CERCLIS contains data on potentially hazardous waste sites that have been reported to the EPA by states, municipalities, private companies, and private persons pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). CERCLIS contains sites that either are proposed to or are on the NPL and sites that are in the screening and assessment phase for possible inclusion on the NPL. This database was last issued on 13 December 2002, and the search distance was 0.5 mile.

- **CERCLIS-NFRAP – CERCLIS No Further Remedial Action Planned.** As of February 1995, CERCLIS sites designated “No Further Remedial Action Planned” (NFRAP) have been removed from CERCLIS. NFRAP sites may be sites where, following an initial investigation, no contamination was found, contamination was removed quickly without the need for the site to be placed on the NPL, or the contamination was not serious enough to require Federal Superfund action or NPL consideration. The source for this data is the EPA. This database was last issued on 13 December 2002, and the search distance was 0.25 mile.

- **CORRACTS - Corrective Action Report.** CORRACTS identifies hazardous waste handlers with Resource Conservation and Recovery Act (RCRA) corrective action activity. This database was last issued on 29 September 2002, and the search distance was 1 mile.

- **RCRIS - Resource Conservation and Recovery Information System.** RCRIS includes selective information on sites which generate, transport, store, treat and/or dispose of
hazardous waste as defined by RCRA. The EPA and the United States Department of Commerce, National Technical Information Service (NTIS) are the sources of this database. This database was last issued on 9 September 2002, and the search distance was 0.25 mile for Large Quantity Generators (LQG) and Small Quantity Generators (SQG), and 0.5 mile for Treatment, Storage, and Disposal (TSD) facilities.

- **ERNS - Emergency Response Notification System.** ERNS records and stores information on reported releases of oil and hazardous substances. The EPA and the NTIS are the sources of this database. This database was last issued on 31 December 2001, and the search distance was limited to the target property.

- **BRS – Biennial Reporting System.** The BRS is a national system administered by the EPA that collects data on the generation and management of hazardous waste. BRS captures data from LQG and TSD facilities. The EPA and the NTIS are the sources of this database. This database was last issued on 31 December 1999, and the search distance was not identified in the EDR report.

- **CONSENT - Superfund (CERCLA) Consent Decrees.** Major legal settlements that establish responsibility and standards for cleanup at Superfund sites. The EPA is the source of this database. The issue date for this database varies, and the search distance was 1.0 mile.

- **ROD - Record of Decision.** ROD documents mandate a permanent remedy at an NPL site containing technical and health information to aid in the cleanup. The NTIS is the source of this database. This database was last issued on 21 December 2001, and the search distance was 1.0 mile.

- **Delisted NPL - NPL deletions.** The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate. The EPA supplies this data. This database was last issued on 18 October 2002, and the search distance was 1.0 mile.

- **FINDS - Facility Index System/Facility Identification Initiative Program Summary Report.** FINDS contains both facility information and "pointers" to other sources that contain more detail. EDR includes the following FINDS databases in this report: PCS (Permit Compliance System), AIRS (Aerometric Information Retrieval System), DOCKET (Enforcement Docket used to manage and track information on civil judicial enforcement cases for all environmental statutes), FURS (Federal Underground Injection Control), C-DOCKET (Criminal Docket System used to track criminal enforcement actions for all environmental statutes), FFIS (Federal Facilities Information System), STATE (State Environmental Laws and Statutes), and PADS (Polychlorinated Biphenyl Activity Database System). This database was last issued on 10 October 2002, and the search distance was limited to the target property.
• HMIRS - Hazardous Materials Information Reporting System. HMIRS contains hazardous material spill incidents reported to the Department of Transportation (DOT). This database was last issued on 31 July 2002, and the search distance was limited to the target property.

• MLTS - Material Licensing Tracking System. MLTS is maintained by the Nuclear Regulatory Commission (NRC) and contains a list of approximately 8,100 sites which possess or use radioactive materials and are subject to NRC licensing requirements. This database was last issued on 21 October 2002, and the search distance was limited to the target property.

• MINES – Mines Master Index File. The source of the data is the Department of Labor, Mine Safety and Health Administration. This database was last issued on 10 September 2002, and the search distance was limited to 0.25 mile.

• NPL LIENS - Federal Superfund Liens. Under the authority granted the EPA by CERCLA of 1980, the EPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner receives notification of potential liability. EPA compiles a listing of filed notices of Superfund liens. This database was last issued on 15 October 1991, and the search distance was limited to the target property.

• PADS - PCB Activity Database System. PADS identifies generators, transporters, commercial storers and/or brokers and disposers of PCBs who are required to notify the EPA of such activities. This database was last issued on 20 September 2002, and the search distance was limited to the target property.

• RAATS - RCRA Administrative Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administrative actions after 30 September 1995, data entry in the RAATS database was discontinued due to a decrease in agency resources. The RAATS database is included in this search for historical reasons. This database was last issued on 17 April 1995, and the search distance was limited to the target property.

• TRIS - Toxic Chemical Release Inventory System. TRIS identifies facilities that release toxic chemicals to the air, water, and land in reportable quantities under SARA Title III Section 313. This database was last issued on 31 December 2000, and the search distance was limited to the target property.

• TSCA - Toxic Substances Control Act. TSCA identifies manufacturers and importers of chemical substances included on the TSCA Chemical Substance Inventory list. It includes data on the production volume of these substances by plant site. This database was last issued on 31 December 1998, and the search distance was limited to the target property.

• SSTS – Section 7 Tracking Systems. Section 7 of the Federal Insecticide, Fungicide and Rodenticide Act as amended (92 Stat. 829). This information is provided by the EPA and includes types and amounts of pesticides, active ingredients and devices being produced, and
those having been produced and sold or distributed in the past year. This database was last issued on 31 December 2000, and the search distance was limited to the target property.

- **FTTS and FTTS INSPI – FIFRA/TSCA Tracking System.** Federal Insecticide, Fungicide, & Rodenticide Act (FIFRA)/TSCA. This information is provided by the EPA, Office of Prevention, Pesticides and Toxic Substances. This database was last issued on 24 October 2002, and the search distance was limited to the target property.

- **SHWS – Inactive Hazardous Waste Disposal Sites in New York State.** State hazardous waste site records are the states’ equivalent to CERCLIS. These sites may or may not already be listed on the federal CERCLIS list. The data come from the NYSDEC. This database was last issued on 1 April 2002, and the search distance was 1 mile.

- **SWF/LF - Solid Waste Facility Directory.** SWF/LF type records typically contain an inventory of solid waste disposal facilities or landfills in a particular state. The information is provided by the NYSDEC. This database was last issued on 31 December 2001, and the search distance was 0.5 mile.

- **LTANKS – Spills Information Database.** Leaking Underground Storage Tank Incident Reports. The records contain an inventory of reported leaking underground storage tank incidents reported from 1 April 1986 through the most recent update. This database was last issued on 1 January 2002, and the search distance was 0.5 mile.

- **UST - Registered Underground Storage Tanks.** USTs are regulated under Subtitle I of RCRA and must be registered with the state department responsible for administering the UST program. The data are provided by the NYSDEC and identifies facilities that have petroleum storage capacities in excess of 1,100 gallons and less than 400,000 gallons. This database was last issued on 1 January 2002, and the search distance was 0.25 mile.

- **CBS UST – Chemical Bulk Storage Database.** The data are provided by the NYSDEC and lists facilities that store regulated hazardous substances in underground tanks of any size. This database was last issued on 1 January 2002, and the search distance was 0.25 mile.

- **MOSF UST – Major Oil Storage Facilities Database.** The data are provided by the NYSDEC and lists facilities that may be onshore facilities or vessels, with petroleum storage capacities of 400,000 gallons or greater. This database was last issued on 1 January 2002, and the search distance was 0.5 mile.

- **VCP – Voluntary Cleanup Agreements.** The program uses private monies to remediate sites and covers virtually any kind of site and contamination. The data are provided by the NYSDEC. This database was last issued on 17 December 2002, and the search distance was 0.5 mile.
• SWRCY – Registered Recycling Facility List. The data are provided by the NYSDEC and lists recycling facilities. This database was last issued on 17 July 2000, and the search distance was 0.5 mile.

• SWTIRE – Registered Waste Tire Storage & Facility List. The data are provided by the NYSDEC and lists registered waste tire storage facilities. This database was last issued on 1 September 2001, and the search distance was 0.5 mile.

• HSWDS – Hazardous Substance Waste Disposal Site Inventory. The data are provided by the NYSDEC and lists any known or suspected hazardous substance waste disposal sites. This database was last issued on 1 September 2002, and the search distance was 0.5 mile.

• AST – Listing of New York’s Registered Aboveground Storage Tanks. The source of this data is the NYSDEC. This database was last issued on 1 January 2002, and the search distance was limited to the target property.

• CBS AST – Chemical Bulk Storage Database. The data are provided by the NYSDEC and lists facilities that store regulated hazardous substances in ASTs with capacities of 185 gallons or greater and/or in USTs of any size. This database was last issued on 1 January 2002, and the search distance was 0.25 mile.

• MOSF AST – Major Oil Storage Facilities Database. The data are provided by the NYSDEC and lists facilities that may be onshore facilities or vessels, with petroleum storage capacities of 400,000 gallons or greater. This database was last issued on 1 January 2002, and the search distance was 0.5 mile.

• SPILLS – Spills Information Database. The data are provided by the NYSDEC and lists data collected on spills active as of 1 April 1986, as well as spills occurring since that date. This database was last issued on 1 January 2002, and the search distance was 0.125 mile.

• MANIFEST – Facility and Manifest Data. The data are provided by the NYSDEC. This database was last issued on 12 September 2002, and the search distance was not identified in the EDR report.

• Coal Gas – Former Manufactured Gas (Coal Gas) Sites. The data are provided by Real Property Scan, Inc., and the search distance was 1.0 mile.

• Brownfields – Brownfields Site List. The data are provided by the NYSDEC. The database was last issued on 22 May 2002 and the search distance was not identified in the EDR report.
3.1.1 Subject Property

The subject property, 270 Main Street, New Rochelle, New York, was listed by EDR on environmental databases as the Naval Armory, US Navy Motion Picture Service, USN/USMC Reserve Center, and City of New Rochelle (Former Armory). In addition, EDR listed an orphan site at 270 East Main Street as "New Rochelle Armory." For the purpose of this report, it is assumed that the subject property also includes this orphan property. The properties identified at 270 Main Street were listed on the LTANKS, RCRIS-SQG, FINDS, AST and UST databases.

According to EDR, the LTANKS database lists one spill for the 270 Main Street site. On 16 March 2001, approximately 25 gallons of #2 fuel oil were spilled due to a tank overfill. The spill is listed as being diked, but it reached a storm drain which led into Long Island Sound. No additional information is included regarding the status of the cleanup.

The RCRIS-SQG database lists the site as a conditionally exempt small quantity generator. No violations were reported. FINDS identified AIRS Facility System (AIRS/AFS), Facility Registry System (FRS) and Resource Conservation and Recovery Act Information System (RCRAINFO) as other pertinent environmental activity at the site. No additional information was provided.

The AST database identifies the "orphan" site at 270 East Main Street as containing an aboveground storage tank. The AST is listed as in-service, containing Nos. 1, 2 or 4 fuel oil.

The UST database lists one UST onsite – an in-service, underground vaulted tank, with access, of steel/carbon steel construction containing fuel oil (Nos. 1, 2 or 4).

3.1.2 Surrounding Properties

Seventy-eight properties were identified on government environmental databases by EDR within the search radii. These surrounding properties were listed on the CERCLIS-NFRAP, CORRACTS, RCRIS, SHWS, LTANKS, UST, NY VCP, CBS AST, SPILLS, Former Manufactured Gas (Coal Gas) Site, and Brownfields databases. Several of these properties occurred on more than one database. Also, properties were listed on additional databases not identified above, when located outside the database designated search radius. A summary of the environmental database information for the surrounding properties, as provided by EDR, is provided below.

CERCLIS-NFRAP - One site, Consolidated Edison on Echo Avenue, is listed on the CERCLIS-NFRAP database. The property is located between 0.125 and 0.25 mile to the southwest of the subject property at a higher elevation. The completed assessment history includes discovery on 19 April 1988, and archive site and preliminary assessment on 30 September 1992. Due to the NFRAP status of this site, adverse impacts to the subject property regarding its listing on the CERCLIS-NFRAP database are not anticipated.

CORRACTS - One site, Rush Manufacturing Corp at 10-12 Pine Ct., is listed on the CORRACTS database. The property is located between 0.5 and 1.0 mile to the west-southwest of the subject property at a higher elevation. The EPA Identification number for the site is identified as NYD075436394. The RCRA Facility Assessment for the property was completed as of 22 September
1992 and the facility was assigned a low corrective action priority as of 3 May 1994. Due to the distance from the property and the low corrective action priority, potential impacts to the subject property are not expected.

RCRIS - Fifteen sites are listed as small quantity generators within 0.25 mile of the subject property. Five of these sites are present between 0 and 0.125 mile of the site, and all 15 sites are located at a higher elevation than the subject property. Based on EDR’s report, one of the sites, Consolidated Edison on Echo Avenue, generated 22,260.00 pounds of D008 Waste (lead) in 1999. The EDR report states that no violations were reported for these facilities; therefore, these properties are expected to have minimal to no impact on the subject property.

SHWS – One site, Consolidated Edison on Echo Avenue, is listed on the SHWS database. As previously stated, the property is located between 0.125 and 0.25 mile to the southwest of the subject property at a higher elevation. PCBs were detected in soils and catch basin sediments and on surfaces within structures at the site. Subsequent sampling, following an initial clean-up, showed PCB levels as high as 50 parts per million (ppm) remaining. A PSA was conducted pursuant to a consent order. It was determined that concentrations of PCBs were still present in soils at levels above the cleanup goals. Additional soils were removed and additional sampling was conducted between 1995 and 1998. Site buildings and structures were removed in 1995. As of 1998, 600 tons of PCB contaminated soil were removed from on and off-site, including residential yards. In addition, backfilling with clean soil was conducted. One final area was to be excavated and backfilled with clean soil in 2002. An exposure assessment and fish and wildlife impact analysis for the off-site mudflat area is reported to be in progress. Due to the close proximity of the SHWS site and the nature and extent of the contamination, possible impacts to the subject property from this site may occur.

LTANKS – Thirty-seven properties, between 0 and 0.5 mile of the site, are listed on the LTANKS database. Table 1 lists the property, its proximity to the subject property, the date the release occurred, the material released, the release quantity, the cause of the release, and the date that the cleanup ceased.

All properties are located at a higher elevation than the subject property except for the Benjamin Residence. No further action (NFA) determinations were identified for Mutual Biscuit Company, Galesi Enterprises, 370 Main Street, 75 Rhodes Street, 17-19 Harding Dr, 152 Sutton Manor Rd and 5 Anderson Street. Tanks and contaminated soil were removed from five of the NFA properties, a tank passed a re-test after refit at the 370 Main Street property, and tanks were removed at the Mutual Biscuit Company.

Contaminated soil was encountered at the New Rochelle Mun. Yard, Defender Marine Supply, Tri Star Hyundai Suzuki, 75 Rhodes Street, New Rochelle Dodge, 17-19 Harding Dr., Oakhurst Gardens Owners, and 7-Up Bottling Co. properties, and contaminated soil and groundwater were encountered at the Salesian H.S. A tank was removed at Premium Cadillac Nissan, a line was leaking at a dispenser at Mario’s S/S, and holes were observed in a UST while it was being pulled at Plastic Works.

</tbody>
</table>
LTANKS listings for Municipal Garage; Guglielmo Residence; Powertest, Echo & Main; Goncalves Residence; Cerratta; and New Rochelle Marina involve limited spills involving overfilling a tank, a sheen on dirty water at the end of the driveway, gasoline odors in basement, overfilling a tank, oil spraying from tank vent, and a leak from a gas pump, respectively.

A groundwater investigation indicated that Sunoco /A-Plus was the source of groundwater contamination on 15 River Street and recovery wells were drilled at the Getty S/S property.

NYSDEC has indicated that NFA is necessary for seven of the sites and cleanup ceased dates were provided for an additional 18 sites; therefore, little or no impact is expected to the subject property from these properties. Due to the lack of information, no determination can be made regarding potential impacts to the subject property for the remaining 12 properties.

As part of this Work Assignment, Foster Wheeler Environmental also prepared a Draft Brownfields Background Memorandum for the adjacent New Rochelle City Yard facility. The record review performed as part of that Brownfields Background Memorandum identified seven spills at the City Yard facility. Two spill reports are identified regarding the tank test failure of a 2,000-gallon gasoline UST, one on 17 April 1998 and one on 1 May 2001. The latter report identified that HydroEnvironmental Solutions (HES) had investigated the spill and that six monitoring wells were installed. It was recommended that a pilot study be conducted to determine a suitable remedial technology. A tank failure was reported to the NYSDEC on 25 June 1998. The NYSDEC sent a letter to the facility on 5 March 2002 stating that the tank and impacted soil must be removed within 60 days. An unknown quantity of waste oil was spilled due to tank failure on 19 June 1998. No cleanup action was determined. A #2 fuel oil tank test failure was reported to the NYSDEC on 6 March 1998. A spill of unknown petroleum was reported emanating from an embankment and going into the Long Island Sound on 4 March 1998. The NYSDEC handled the spill with the installation of a floatable debris collection system. Ten gallons of diesel was spilled as a result of a tank overfill on 19 February 1998. The spill is reported as being cleaned up with Speedi-Dri. Tank failure is listed as the cause of a 50-gallon gasoline spill that occurred on 17 September 1992. Approximately 5 yards of contaminated soil were removed and the ruptured underground storage tank line was repaired. A gasoline release at the site on 13 June 1991 may have originated from the gas station across the street. The incident was identified as an over fill spill that was cleaned up. A tank test confirmed that the tank was not leaking.

It is recommended that additional efforts be made to retrieve supplemental information regarding these spills at the New Rochelle City Yard and that soil and groundwater sampling be performed on the City Armory property to evaluate potential subsurface impacts as a result of these spills.

UST – Fifteen UST sites are located within 0.25 mile of the subject property. Table 2 identifies the property, distance and direction from the subject property, and tank quantity(ies), contents and status.

</table>

Tank capacity data was not provided in the EDR report. As described in Section 3.1, the UST database provides information regarding the presence of registered underground storage tanks. Data
regarding releases or leaks from said tanks is not provided. Therefore, properties occurring on the UST database would not be considered an environmental threat to the subject property based solely on their presence on the UST database.

NY VCP and Brownfields - One site, Con Edison-Cedar St Works-New Rochelle MGP, is listed on the Voluntary Cleanup Agreements and Brownfields databases. Limited information provided in the EDR report includes the agreement type (VCP Agreement) and date signed (25 August 2002). Because no information is provided as to the nature or extent of contamination or the progress of any cleanup activities, a determination of the property’s environmental threat to the subject property cannot be made.

CBS AST - One site, the N R Wastewater Treatment Plant, is listed on the CBS database. Information for four ASTs is provided; however, a total of five tanks with a total capacity of 9,000 gallons are referenced. The four tanks are used to store sodium hypochlorite. Two tanks each have a capacity of 1,900 gallons and 2,100 gallons. As with the UST database, the CBS AST database identifies only the presence of a tank, not the occurrence of any environmental threat. Therefore, a determination of the property’s environmental threat to the subject property cannot be made based on its CBS AST listing.

SPILLS – Nine sites are listed on the NY Spills database. The sites are located between 0 and 0.125 mile from the subject property and are identified as Bldg. 3 St & Highway Dept, 40 Huntington Place, Mc Donald’s, Cement Plant, Nelstad, Huntington Place, Echo Bay Marina, City Yard New Rochelle, and Roadway. According to the database, the “spill” at Bldg. 3 St. & Highway Dept reported on 3 September 1991 was a result of a tank overfill from the gas station across the street. The gas station arranged for the spill cleanup and confirmed the tank was not leaking. The spill at 40 Huntington Place involved the reporting of sewage in a creek on 26 June 1995. According to the database, no spill occurred, and no corrective action was required. The spill at Mc Donald’s occurred on 30 June 2000 and involved children playing with mercury. A cleanup of a minor amount of mercury at McDonalds was performed by Tri-State Cleanup. An unknown petroleum sheen was observed at the outfall of a storm drain from the Cement Plant on 14 April 1994. On 23 September 1998, a spill was reported as a result of a Nelstad Concrete Truck breaking a hydraulic hose and spilling approximately 5 gallons of hydraulic oil on the road. Approximately one gallon of an unknown petroleum was spilled into a storm drain entering the Long Island Sound at Huntington Place. The spill was cleaned on 17 December 1993. The spill reported on 7 May at the Echo Bay Marina involved an unrecoverable amount of an unknown petroleum runoff from a roadway. The spill at City Yard New Rochelle on 4 March 1998 involved an unknown petroleum leaking from an embankment and entering the Long Island Sound. A floatable debris collection system was installed as a result. On 24 October 1997, approximately 10 gallons of hydraulic oil were spilled on the roadway at 30 Huguenot Street. Based on the types and amounts of materials spilled and the proximity of the site, the potential impacts to the subject property are minimal.

Former Manufactured Gas (Coal Gas) Site - The New Rochelle Gas Co., 53 Cedar, New Rochelle, NY is listed as a Coal Gas Site. The site is located between 0.25 and 0.5 mile west of the subject property at a higher elevation. The former coal gas facility is described as being located on the southeast corner of Spring Street and Cedar (formerly Center) and being subsequently called
American Gas Lite Co. and New York Suburban Gas Co. Due to its distance from the subject property, environmental impacts from the Coal Gas Site are not anticipated.

3.1.3 Orphan Sites

Sixty-nine orphan (unmappable due to inadequate address information) sites are denoted in the EDR report. Forty-eight of the sites are listed on the NY SPILLS database, nine are listed on the ERNS database, six are listed on the UST/AST database, three are listed on the RCRIS-SQG and FINDS databases, and three are listed on the LTANKS database. Table 3 lists the site name, address and database in which it occurred.

All sites are located in New Rochelle. As discussed in Section 3.1.2, the mere presence of underground storage tanks at the six sites identified on the UST database does not pose an environmental concern to the subject property. The limited information provided for the remaining orphan sites curtails the possibility of determining if they would be of environmental concern to the subject property.
3.1.4 Wells

Three well databases (Federal USGS, Federal FRDS Public Water Supply (PWS), and State Database) were searched by EDR for the occurrence of potable water wells within a one-mile radius of the City Armory property. Table 4 provides the database in which the well was listed, the well ID number, its distance and direction from the subject property, the well depth and the depth to water table.

Table 4 - Summary of Wells

</tbody>
</table>

The primary uses of water for the Federal USGS wells are identified as commercial (three wells) and industrial (two wells). The remaining USGS well is listed as unused. According to the EDR report, the PWS well currently has or had major violation(s) or enforcement actions. Information regarding the direction of groundwater flow was not provided by EDR. Based on the information provided by the EDR report that the above listed wells are higher in elevation than the subject property, these wells are not likely to be impacted by the City Armory property.

3.2 Freedom of Information Act (FOIA) Requests

Foster Wheeler Environmental submitted FOIA requests to the EPA, NYSDEC, Westchester County Clerk, and Westchester County Health Department requesting information on all files regarding the City Armory property on 24 February 2003. Based on a telephone conversation with Ms. Melissa Nacerino, Director of Public Affairs, on 26 February 2003, the Westchester County Clerk’s Office does not maintain records of environmental issues.

Acknowledgement letters were received from the Westchester County Health Department, the EPA and NYSDEC. Anticipated responses to the FOIA requests were estimated at within twenty days for the EPA and by 20 March 2003 for the Westchester County Health Department and NYSDEC. Copies of FOIA responses are provided in Appendix B. Responses from regulatory agencies received subsequent to the completion of this draft report will be forwarded to the EPA as addenda.
3.3 Physical Setting Sources

3.3.1 USGS Topographic Map

The United States Department of the Interior, Geological Survey (USGS) Topographic Map Quadrangle (7.5-minute series) for Mount Vernon, N.Y. (dated 1966, photorevised 1979) was obtained to provide information on the subject property. The topography of the site slopes gently to the southeast with elevations ranging from 0 to 30 feet above mean sea level (msl). Site structural features are not identified on the map. The subject property and the surrounding area are shown in Figure 1.

3.3.2 Federal Emergency Management Agency Flood Insurance Rate Map

The FEMA FIRM for the City of New Rochelle, New York was reviewed to determine if the City Armory property occurs within a flood hazard area. According to panels 6 and 7 (community-panel numbers 360922 0006 C and 360922 0007 C, respectively), approximately 85 percent of the site occurs within areas of minimal flooding (Zone C). Approximately 10 percent of the site occurs within the 500 and 100-year floodplain (Zone B), and is comprised of two areas—a strip of land along the northeastern boundary edge approximately 50 feet in width, and approximately 5,000 square feet in the southeastern corner of the site. The remaining 5 percent of the site (area adjacent to Echo Bay) occurs within Zone A8, the 100-year floodplain.

3.3.3 Putnam and Westchester Counties Soil Survey

According to the Soil Survey of Putnam and Westchester Counties, New York (1994) the site soils are identified as Uf (Urban land). Urban lands are described as areas where at least 60 percent of the land surface is covered with buildings or other structures.

3.3.4 Westchester County GIS Database

NWI wetland, NYSDEC wetland, Tidal wetland, hydric soil wetland, and critical environmental area data were downloaded from the Westchester County GIS database. According to this database, there are no mapped wetlands within the boundaries of the subject property. Estuarine Non-vegetated (E1UBL) wetlands are identified by NWI as occurring along the eastern and southern edges of the subject property. NYSDEC wetlands are not present on or within the vicinity of the subject property. Coastal Shoals/Bars/Mudflats (SM) tidal wetlands are present in Echo Bay. Westchester County listed hydric soil wetlands are not located on the subject property. Udorthents, wet substratum (Uc) hydric soils are present on the northern and southern edges of the channel leading into Echo Bay from Long Island Sound. These hydric soils are defined as somewhat poorly drained to very poorly drained soils that have been altered mainly by filling. Based on the County database, the City Armory property is located within the County Designated Long Island Sound Critical Environmental Area.
3.4 Historical Use Information Sources

3.4.1 Aerial Photographs

Historical aerial photographs for the years 1951, 1959, 1962, 1965, 1969, 1980, 1992, 1993, 1996, and 1999 were reviewed in order to obtain a representative understanding of the City Armory property’s development. Coverage of the site prior to 1951 was not available.

1951 – The City Armory property boundaries appear defined in the 1951 aerial photograph. Three buildings are located across the northern portions of the property. The largest curved-roof building identified as the Naval Militia Armory Drill Shed from the 1951 Sanborn map is rectangular and appears to be connected to the adjacent flat-roofed rectangular building. An access road connecting Main Street and the Drill Shed is present. The main access road from Main Street starts in the northeastern corner of the property and follows through to the cluster of buildings. The third building in the cluster has a triangular roof and is located east of the Drill Shed, behind the flat-roofed rectangular building. A path appears to be present starting from the southeast side of the Drill Shed, moving southeast towards the southeast corner of the property near the presumed dock in a curved, sideways “s” shape. The border along Echo Bay includes a presumed dock or pier on the southeast corner of the property. A small oval shaped anomaly on the eastern border along the wall that borders the property is present. The southern portion of the property is vacant.

Directly to the east of the Armory property is the City Yard Property. Four buildings occur in the northern and central portions of the site. One building is segmented and L-shaped. It extends from the northern corner of site southwest along Main Street for about half of the property’s width, and then southeast through the center of the property for about half the property’s length. The flat roof structure of the southern portion of the segmented building differs from the angled structure of the remaining portion of the building, indicating different construction dates. A large flat roofed rectangular building is located in the center of the southwestern half of the property and two smaller detached buildings are located in the center of the southern half of the property.

Directly to the west of the northern portion of the Armory property is a structure surrounded by a parking lot filled with cars. To the west of the land parcel occupied by the concrete mixing plant is the Mancuso Marina property, covered with a cluster of elongated-oval shaped anomalies, which appear to be boats, along the eastern portion of the site.

1959 – The cluster of three structures as well as the access roads and paths, are still present on the property. The oval shaped anomaly located along the eastern border identified on the 1951 aerial photograph is absent in 1959. However, a small rectangular structure adjacent to the dock on the southern border along the bay is present. A small rectangular structure is also located directly in front of the main access road in the middle of the property, absent in the 1951 photograph.

To the east of the Armory in the City Yard Property, two of the three rectangular structures located at the southern tip of the property, as identified on the 1951 aerial photograph, are absent in 1959. Two additional buildings are present on the site in the northeastern half of the property. One building is located in the center of the parking area, and the other building is located along the northeastern site boundary. Anomalies are present along the northeastern edge of the property along Echo Bay.
and anomalies and automobiles are present in the enclosed northwestern portion of the site, indicating their possible use for material storage. On the concrete mixing property to the west of the Armory, the only change is the presence of a barge in the marina adjacent to the property.

In the Mancuso Marina to the east, the structures identified in the 1951 aerial photograph still appear in the 1959 photograph. The cluster of elongated-oval shaped anomalies, suspected to be boats, occupy the majority of the site boundary. A large rectangular structure is located on the southwestern corner of the site. Another rectangular structure is adjacent, however, it is not located within the site boundaries. Additionally, a large structure consisting of adjoined multiple square shaped structures adjacent to a narrow-pier-like structure extends from the site into the bay to the marina.

An access road connecting Main Street to Huntington Place is located directly east of the Armory Site.

1962 – No apparent changes on the property from 1959 are present in the 1962 aerial photograph. The City Yard property to the east exhibited slight changes. The remaining rectangular structure located at the southern tip of the property is absent in the 1962 aerial photograph. Anomalies are present in the northwestern corner and along the northeastern edge of the property indicating material storage. Possible ground scaring is apparent in the vegetated area to the south of the rectangular building. The concrete mixing property remained the same including the presence of the barge. The most apparent change on the Mancuso Marina property to the west, is the absence of the large pier-like structure that extended from the site into the bay. Boats appear to be present between the large rectangular structure on the site and the adjacent structure on the land parcel to the west of the site. The access road to the west of the Armory that previously connected Main Street and Huntington Station now ends at a dead end, aligned with parked cars. The remaining structures surrounding the Armory remain the same.

1965 – No apparent changes on the property from 1962 are present in the 1965 aerial photograph. No apparent changes were observed in the City Yard property to the east from the 1962 photograph. To the west, the only changes observed is the inclusion of the marina connected to the southeastern corner of the Mancuso Marina property by a series of piers. Several boats are docked in the marina. The remaining surrounding areas demonstrated no changes.

1969 – The area adjacent to the eastern side of the dock located in the southeastern corner of the property has been filled to increase the neighboring land mass and align the two properties. The area behind the cluster of large buildings appears to have been transformed into a small parking lot. The remaining structures and access roads of the property remain the same.

On the City Yard property to the east, a portion of the segmented building in the northern corner has been reduced in size and now appears to be the main entrance to the site. An additional flat roofed rectangular building, equal in size to the aforementioned rectangular building, is present in the southern portion of the site. The site has expanded into Echo Bay to the south and northeast. Automobiles are parked in the northwestern corner of the site. Anomalies are present in the northeast half of the site, indicating material storage.
Structures on the concrete mixing station to the west remained the same. On the Mancuso Marina, the boats remain to cover the site property. The marina is still present on site, surrounded by docked boats. The large structure identified in the 1959 aerial photograph is absent and is replaced by more boats. An anomalous structure slightly larger than the surrounding boats, presumably a building, is located on the northwest corner of the site. The outline of the bay is similar to that observed in the 1965 photograph, but more defined. Trees surround the inclusion to the west of the bay. The remaining structures surrounding the Armory property are intact.

1980 – The structures on the City Armory property remain the same. The access road connecting the main building to the dock is no longer present. The area to the east of the dock continues to be filled and joined to the City Yard property. The border of the water along the adjacent site to the west has been filled, narrowing the channel that leads to the marina.

The City Yard property to the west has extended into Echo Bay to the northeast, east, and south. Anomalies are present in the northwest corner of the site, southern tip, and eastern portion of the site, indicating material storage. The small building that was previously located in the center of the parking area in the northeastern half of the property is absent. The barge next to the concrete mixing plant has also been removed.

1992 – A large rectangular parking lot is present south of the cluster of buildings previously mentioned. This lot is adjacent to the small building that is still located at the end of the main access road. The remainder of the property does not appear to have undergone any changes. On the City Yard property to the west, anomalies are present in the northwestern corner and along the eastern edge of the site along Echo Bay indicating material storage. Automobiles are parked primarily in the northeastern half of the property.

1993 – The area remains the same as that observed in the 1992 aerial photograph, with one exception. The earlier mentioned access road connecting the main building to the former dock area is not apparent.

On the City Yard property, anomalies are present in the northwestern corner of the property and along the northeast, eastern, and southern edges of the property, indicating material storage. Automobiles and trucks are present in the northeastern half of the property. To the west, no apparent changes on Mancuso Marina from 1992 are present on the 1993 aerial photograph. In the surrounding areas, two square structures are present directly west of the two buildings located on the Mancuso Marina Property. The remaining surroundings demonstrated no apparent change.

1996 – Structurally, no changes are apparent in the 1996 aerial photograph. The access road connecting the main building to the former dock area (not observed in the 1993 aerial photograph) is present. Seasonal vegetation may cause the variation in appearance from one aerial photograph to the next. In addition, the southern border along the coastline appears to have been filled, slightly expanding the property and smoothing the previously rigid border.
On the City Yard property, three three-sided concrete storage structures are apparent along the northeastern edge of the site. Anomalies are present in the northwestern corner, and southeastern and southern edge of the site indicating material storage. Automobiles and trucks are concentrated in the northeastern half of the site.

Further west along the Mancuso Marina property, fewer boats appear to be present. Most of the boats are observed to be located on the eastern portion of the site. The marina has been reduced from an extensive marina to a dock. The most significant change in the surrounding areas is the demolition and removal of the former Westchester Lighting Company's Electric Building and Station. The footprints of the former building are observed in its place.

1999 – The property remains the same as that observed in the 1996 aerial photograph. Site features on the City Yard property remain relatively unchanged from the 1996 aerial photograph on the aerial photograph from 1999. All boats have been removed off the Mancuso Marina's boundaries. The dock noted in the 1996 photograph has been removed as well. The coastline of the bay is more distinct. The surrounding areas remained the same as that observed in the 1996 aerial photograph.

3.4.2 Sanborn Fire Insurance Maps

EDR Sanborn fire insurance maps for the years 1911, 1931, 1942, 1951, and subsequent years from 1990 to 1996 were reviewed to ascertain the historical uses of the City Armory property located between the cross roads of Main Street and Huguenot Street to the north and Echo Bay to the south, adjacent to Huntington Place. Copies of the maps are provided in Appendix C.

The 1911 Sanborn fire insurance map indicates three structures located on the property, two unnamed, and the other labeled tool shed. The largest structure is approximately 450 feet southeast from Main Street. An unnamed roadway passage is indicated on the map, which enters approximately 100 feet into the property. Adjacent to the northeast of the property, two other structures are represented on the map. One is labeled as portal and the other is unnamed. The edge of the property along Echo Bay on the southeast corner of the property indicates a dock.

The 1931 Sanborn map denoted little change on the property. Four additional unnamed structures were erected, one by the tool shed and three more clustered approximately 120 feet to the south. The dock on the southeast corner of the property on the edge of Echo Bay was filled. The Department of Public Works erected several buildings along the eastern border of the site. The buildings are labeled Sewage Disposal Plant, Compost Building, Street Cleaning Machinery, Auto Trucks, Tools, Storage and Office.

The 1942 Sanborn map indicates the erection of the Naval Militia Armory Drill Shed on the northern portion of the property, closest to Main Street. Additionally, along the edge of Echo Bay, several docks have been built. The DPW has been transferred to the Department of Streets. Roadways entering the property between the property and the Department of Streets are indicated on the map as well.
The 1951 Sanborn map does not illustrate the docks that were noted in the 1942 Sanborn map. None of the original structures from the 1911 Sanborn map are present on the 1951 map. On the adjacent site, a municipal garage was built to the west of the Sewage Disposal Plant. To the west of the property, two unnamed structures are present. The remaining structures on the adjacent properties remain the same.

Only the northern portion of the property is represented in the 1990 Sanborn map. Of what is present on the map, the structures of the northern portion of the property remain the same. Areas surrounding the Drill Shed structure are paved to provide parking. Southeast of the Municipal Garage on the adjacent property illustrates another structure along the water labeled “iron.” Another unnamed structure was erected on the property west of the site at the end of Huntington Place. Subsequent years 1991 to 1996 only reveal the northern portion of the property. These maps indicate no change since the 1990 Sanborn map.
4.0 INFORMATION FROM SELECT INTERVIEWS

On Wednesday, 5 March 2003, Dr. Robert Chozick and Mr. Richard Delahunty of Foster Wheeler Environmental met with Messrs. Craig King, Commissioner, Department of Development; Lewis Wendell, Deputy Commissioner, Department of Development; John Clemente, Deputy Commissioner and City Engineer, Department of Public Works; and Kaz Orszulik, Senior Engineer, Department of Public Works, all with the City of New Rochelle, New York. In addition, Mr. Richard Delahunty conducted a telephone interview with Bernis Shapiro of the City of New Rochelle Legal Department on Friday, March 7, 2003. Background ownership information and property transfer dates for the City Armory were discussed. The information obtained during these interviews has been incorporated into Section 2.0, Site Description, and throughout the document.
5.0 CONCLUSIONS AND RECOMMENDATIONS

Foster Wheeler Environmental has performed this background investigation of the City Armory property on behalf of the EPA. The northwestern portion of the property is developed and occupied by buildings, storage structures, parking, and driveway areas. The southeastern portion of the property is predominantly undeveloped. The area is currently zoned M-1 and M-3, which is identified as light and heavy manufacturing, respectively. Mixed commercial properties including restaurants, delicatessens, car dealers, and small retail shops line Main Street in the vicinity of the property. Residential properties dominate the secondary streets.

The City Armory property is contiguous to Echo Bay of the Long Island Sound and is located within the Westchester County Designated Long Island Sound Critical Environmental Area. The topography of the property slopes gently to the southeast with elevations ranging from 0 to 30 feet above msl. The portion of the property contiguous to Echo Bay, approximately 5 percent, occurs within the 100-year floodplain. Areas of minimal flooding comprise approximately 10 percent, 85 percent of the remaining subject property occurs within the 500-year floodplain. The site soils are identified as Urban land where at least 60 percent of the land surface is covered with buildings or other structures. Estuarine non-vegetated wetlands are identified by the NWI as occurring along the eastern and southern edges of the subject property.

Three well databases (Federal USGS, Federal FRDS PWS, and State Database) were searched by EDR for the occurrence of potable water wells within a one-mile radius of the property. Six Federal USGS wells and one Federal FRDS PWS well are located within one mile of the City Armory property. One of the Federal USGS wells was identified as unused. The primary uses of water for the remaining wells include commercial (three wells) and industrial (two wells). The PWS well currently has or had major violation(s) or enforcement actions. Information regarding the direction of groundwater flow was not provided by EDR.

Foster Wheeler Environmental’s investigation identified the following areas of concern and associated recommendations.

- **Spills** – One spill was identified by EDR as occurring at the City Armory property. On 16 March 2001, approximately 25 gallons of #2 fuel oil were spilled due to a tank overfill. Most of the spill was contained in a diked area, but some of it reached a storm drain which led into Long Island Sound. Cleanup activities were not described in the database. It is recommended that additional efforts be made to retrieve supplemental information regarding this spill as part of the ongoing site investigation, and if necessary, soil sampling be performed in the vicinity of the spill to evaluate potential subsurface impacts.

- **Above Ground Storage Tank (AST)** – The EDR report lists an AST at the facility. It is recommended that additional efforts be made to retrieve supplemental information regarding this AST as part of the ongoing site investigation. If stained areas are observed in the vicinity of the AST during the site inspection, soil sampling should be performed in the stained areas to determine if any environmental impacts have resulted from the AST.
• New Rochelle City Yard – Seven spills were identified at the adjacent New Rochelle City Yard property. A 2,000-gallon gasoline UST failed at the New Rochelle City Yard. Approximately 1,400-gallons of free product was pumped out of the basement of a former treatment plant. A groundwater and soil investigation performed by HES concluded that dissolved and adsorbed BTEX compounds were present in the soils and groundwater beneath the City Yard site. Free-phase liquid hydrocarbon was documented in one of six monitoring wells. VOC vapor screening results of drill cuttings and soil samples and analytical results of soil and groundwater samples indicate that the majority of hydrocarbon impact is restricted to the westerly portion of the site. It is recommended that groundwater samples be collected at the City Armory to evaluate potential impacts from the City Yard site.

• Consolidated Edison Property – A former Consolidated Edison substation was located on Echo Avenue between 0.125 and 0.25 mile to the southwest of the subject property at a higher elevation. According to EDR, the facility was listed on the CERCLIS-NFRAP, RCRIS, SHWS, FINDS, TRIS and NY SPILLS databases. Cleanup activities to remove PCB contaminated soil and sediment from the Consolidated Edison property, adjacent commercial and residential properties, and the Echo Bay tidal lands are almost complete. The cleanup involved removing contaminated material and covering with clean fill. Based on the EDR report, final remedial activities were to have been completed in 2002. Although it falls outside of the spill search distance, the SPILL database identifies a petroleum release of 3,400 gallons on 1 January 1998. The release occurred as a result of an oil/water separator malfunction. Most of the spill (3,300 gallons) was contained in a diked area. The remaining 100 gallons overflowed. According to the EDR report, Consolidated Edison cleaned up the spill and the water contained less than 1 ppm PCBs. It is recommended that soil and sediment samples be collected from the southern portion of the property along Echo Bay and analyzed for PCBs to evaluate potential impacts to the property from the former Consolidated Edison facility.

• Lead-based Paint and Asbestos Containing Building Material (ACBM) – Due to the age of the buildings at the property, the possibility of the presence of lead-based paint and ACBM in the structures exists. If suspect material is observed during the site inspection, sampling of the material should be performed to assess the possible presence of lead-based paint and/or ACBM.

• Drains – If it is determined that floor drains are present within the facility’s structures, the discharge points should be determined and samples collected in the drain and at the discharge location, if possible.

• Transformers - If it is determined that transformer(s) are present at the property, and stained areas are observed in the vicinity of the transformer(s) during the site inspection, soil sampling should be performed in the stained areas to determine if any environmental impacts have resulted from the transformer.

EXECUTIVE SUMMARY

DATABASES WITH NO MAPPED SITES
No mapped sites were found in EDR's search of available ("reasonably ascertainable") government records either on the target property or within the ASTM E 1527-00 search radius around the target property for the following databases:

### FEDERAL ASTM STANDARD
- NPL: National Priority List
- Proposed NPL: Proposed National Priority List Sites
- CERCLIS: Comprehensive Environmental Response, Compensation, and Liability Information System
- RCRIS-TSD: Resource Conservation and Recovery Information System
- RCRIS-LOG: Resource Conservation and Recovery Information System
- ERNS: Emergency Response Notification System

### STATE ASTM STANDARD
- SWF/LF: Facility Register
- CBS UST: Chemical Bulk Storage Database
- MOSF UST: Major Oil Storage Facilities Database
- SWTIRE: Registered Waste Tire Storage & Facility List
- SWRCY: Registered Recycling Facility List

### FEDERAL ASTM SUPPLEMENTAL
- CONSENT: Superfund (CERCLA) Consent Decrees
- ROD: Records Of Decision
- Delisted NPL: National Priority List Deletions
- HMIRS: Hazardous Materials Information Reporting System
- MLTS: Material Licensing Tracking System
- MINES: Mines Master Index File
- NPL Liens: Federal Superfund Liens
- PADS: PCB Activity Database System
- RAATS: RCRA Administrative Action Tracking System
- TRIS: Toxic Chemical Release Inventory System
- TSCA: Toxic Substances Control Act
- SSTS: Section 7 Tracking Systems
- FTTS: FIFRA/TSCA Tracking System - FIFRA (Federal Insecticide, Fungicide, & Rodenticide Act)/TSCA (Toxic Substances Control Act)

### STATE OR LOCAL ASTM SUPPLEMENTAL
- HSWDS: Hazardous Substance Waste Disposal Site Inventory
- AST: Petroleum Bulk Storage
- MOSF AST: Major Oil Storage Facilities Database

### BROWNFIELDS DATABASES
Brownfields Site List

### SURROUNDING SITES: SEARCH RESULTS
Surrounding sites were identified.
Elevations have been determined from the USGS 1 degree Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. EDR's definition of a site with an elevation equal to the target property includes a tolerance of +/- 10 feet. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property (by more than 10 feet). Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in **bold italics** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

### FEDERAL ASTM STANDARD

**CERCLIS-NFRAP:** As of February 1995, CERCLIS sites designated "No Further Remedial Action Planned" (NFRAP) have been removed from CERCLIS. NFRAP sites may be sites where, following an initial investigation, no contamination was found, contamination was removed quickly without the need for the site to be placed on the NPL, or the contamination was not serious enough to require Federal Superfund Action or NPL consideration. EPA has removed approximately 25,000 NFRAP sites to lift the unintended barriers to the redevelopment of these properties and has archived them as historical records so EPA does not needlessly repeat the investigations in the future. This policy change is part of the EPA's Brownfields Redevelopment Program to help cities, states, private investors and affected citizens to promote economic redevelopment of unproductive urban sites.

A review of the CERC-NFRAP list, as provided by EDR, and dated 12/13/2002 has revealed that there is 1 CERC-NFRAP site within approximately 0.25 miles of the target property.

**RCRIS:** The Resource Conservation and Recovery Act database includes selected information on sites that generate, store, treat, or dispose of hazardous waste as defined by the Act. The source of this database is the U.S. EPA.

A review of the RCRIS-SQG list, as provided by EDR, and dated 09/09/2002 has revealed that there are 15 RCRIS-SQG sites within approximately 0.25 miles of the target property.

### STATE ASTM STANDARD

SHWS: The State Hazardous Waste Sites records are the states’ equivalent to CERCLIS. These sites may or may not already be listed on the federal CERCLIS list. Priority sites planned for cleanup using state funds (state equivalent of Superfund) are identified along with sites where cleanup will be paid for by potentially responsible parties. The data come from the Department of Environmental Conservation’s Inactive Hazardous waste Disposal Sites in New York State.

A review of the SHWS list, as provided by EDR, has revealed that there is 1 SHWS site within approximately 1 mile of the target property.

### LTANKS: Leaking Storage Tank Incident Reports

These records contain an inventory of reported leaking storage tank incidents reported from 4/1/86 through the most recent update. They can be either leaking underground storage tanks or leaking aboveground storage tanks. The causes of the incidents are tank test failures, tank failures or tank overfills.

A review of the LTANKS list, as provided by EDR, and dated 01/01/2002 has revealed that there are 37 LTANKS sites within approximately 0.5 miles of the target property.

**NY VCP**: Voluntary Cleanup Agreements. The voluntary remedial program uses private monies to get contaminated sites remediated to levels allowing for the sites' productive use.

The program covers virtually any kind of site and contamination.

A review of the VCP list, as provided by EDR, and dated 12/17/2002 has revealed that there is 1 VCP site within approximately 0.5 miles of the target property.

EXECUTIVE SUMMARY

STATE OR LOCAL ASTM SUPPLEMENTAL

CBS AST: Chemical Bulk Storage Database. Registration data collected as required by 6 NYCRR Part 596. It includes facilities storing hazardous substances listed in 6 NYCRR Part 597, in aboveground tanks with capacities of 185 gallons or greater, and/or in underground tanks of any size. Includes facilities registered (and closed) since effective date of CBS regulations (July 15, 1986) through the date request is processed.

A review of the CBS AST list, as provided by EDR, and dated 01/01/2002 has revealed that there is 1 CBS AST site within approximately 0.25 miles of the target property.

SPILLS: Data collected on spills reported to NYSDEC, is required by one or more of the following:
- Article 12 of the Navigation Law, 6 NYCRR Section 613.8 (from PBS regs), or 6 NYCRR Section 565.2 (from CBS regs). It includes spills active as of April 1, 1986, as well as spills occurring since this date.

A review of the NY Spills list, as provided by EDR, has revealed that there are 9 NY Spills sites within approximately 0.125 miles of the target property.

Soil Data: Yes
Soil Type: Fill mixed with silt, sand and gravel.
Remediation Proposed: Not reported
Remediation Active: Not reported
Remediation Design: Not reported
Remediation Type: Not reported
Quantity: unknown
NPL Status: —
Hazardous Waste: PCBs (BB07)

The site, approximately 150 feet x 600 feet in size, was originally owned by Westchester Lighting Co. and subsequently was acquired by Consolidated Edison in the early 1930's. Con Ed operated an electrical distribution substation at this site until 1981, when the substation was closed. The site is bounded by a fuel oil dealer, a tidal creek, Echo Bay (Long Island Sound), and private residences. The site includes substation buildings and a transformer yard. PCBs have been found in soils and catch basin sediments, and on surfaces within structures. Con Ed has completed initial clean-up. Subsequent sampling showed PCB levels as high as 50 ppm remaining. A Preliminary Site Assessment (PSA) was conducted pursuant to a consent order. The results showed areas of site soils to be contaminated with PCBs above the cleanup goals of 1 ppm. These soils were removed from the site. Additional sampling of both on-site and off-site soils and sediment were conducted between 1995 & 1998. One sample showed high levels of PCBs in soils greater than 1900 ppm. Echo Bay sediments showed one area at 220 ppm. All site buildings and structures were removed in August of 1995. As of February 1998, 600 tons of PCB contaminated soil was removed from on and off site, including four residential yards. Removal of on-site concrete slabs and soil sampling of those soils under each slab has been completed and small quantities of PCB contaminated soils and sediments in unmapped buried trenches were removed. Backfilling with clean soil in parts of the site was completed. One final area of the site will be excavated and backfilled with clean soil in 2002. An exposure assessment and a fish and wildlife impact analysis for the off-site mud flat area are in progress.

On site soil and sediment contain PCBs. Echo Bay sediments contain significant levels of PCB. The back yards of private residences were
CONSOLIDATED EDISON - ECHO AVE. SITE (Continued)

Health Problems:

found to be contaminated with PCBs at levels from 1.1 to 5.6 ppm. The site is immediately adjacent to residential and commercial properties and extends to the Echo Bay tidal lands. Access to the site is restricted by chain link fencing. PCBs had been found at elevated levels in the former substation building and surrounding soil. Cleanup of PCBs is nearing completion and the majority of the site has been covered with clean fill. Final remedial activities should be completed in 2002. Soil sampling conducted at adjacent residential properties found PCBs in four yards above the cleanup guideline of 1 part per million. The PCB contaminated soils in the yards were excavated and removed. There are no known drinking water supply wells in the vicinity.

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Elapsed ASTM days: Provides confirmation that this EDR report meets or exceeds the 90-day updating requirement of the ASTM standard.

FEDERAL ASTM STANDARD RECORDS

NPL: National Priority List
Source: EPA
Telephone: N/A
National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Date of Government Version: 10/24/02
Date Made Active at EDR: 12/09/02
Database Release Frequency: Semi-Annually

Proposed NPL: Proposed National Priority List Sites
Source: EPA
Telephone: N/A

Date of Government Version: 10/24/02
Date Made Active at EDR: 12/09/02
Database Release Frequency: Semi-Annually

CERCLIS: Comprehensive Environmental Response, Compensation, and Liability Information System
Source: EPA
Telephone: 703-413-0223

CERCLIS contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). CERCLIS contains sites which are either proposed to or on the National Priorities List (NPL) and sites which are in the screening and assessment phase for possible inclusion on the NPL.

Date of Government Version: 12/13/02
Date Made Active at EDR: 01/15/03
Database Release Frequency: Quarterly

CERCLIS-NFRAP: CERCLIS No Further Remedial Action Planned
Source: EPA
Telephone: 703-413-0223

As of February 1995, CERCLIS sites designated "No Further Remedial Action Planned" (NFRAP) have been removed from CERCLIS. NFRAP sites may be sites where, following an initial investigation, no contamination was found, contamination was removed quickly without the need for the site to be placed on the NPL, or the contamination was not serious enough to require Federal Superfund action or NPL consideration. EPA has removed approximately 25,000 NFRAP sites to lift the unintended barriers to the redevelopment of these properties and has archived them as historical records so EPA does not needlessly repeat the investigations in the future. This policy change is part of the EPA's Brownfields Redevelopment Program to help cities, states, private investors and affected citizens to promote economic redevelopment of unproductive urban sites.
CORRACTS: Corrective Action Report
Source: EPA
Telephone: 800-424-9346
CORRACTS identifies hazardous waste handlers with RCRA corrective action activity.

Date of Government Version: 09/29/02
Date Made Active at EDR: 12/26/02
Database Release Frequency: Semi-Annually

RCRIS: Resource Conservation and Recovery Information System
Source: EPA/NTIS
Telephone: 800-424-9346
Resource Conservation and Recovery Information System. RCRIS includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA).

Date of Government Version: 09/09/02
Date Made Active at EDR: 10/28/02
Database Release Frequency: Varies

ERNS: Emergency Response Notification System
Source: National Response Center, United States Coast Guard
Telephone: 202-260-2342
Emergency Response Notification System. ERNS records and stores information on reported releases of oil and hazardous substances.

Date of Government Version: 12/31/01
Date Made Active at EDR: 07/15/02
Database Release Frequency: Annually

FEDERAL ASTM SUPPLEMENTAL RECORDS

BRS: Biennial Reporting System
Source: EPA/NTIS
Telephone: 800-424-9346
The Biennial Reporting System is a national system administered by the EPA that collects data on the generation and management of hazardous waste. BRS captures detailed data from two groups: Large Quantity Generators (LQG) and Treatment, Storage, and Disposal Facilities.

Date of Government Version: 12/31/99
Database Release Frequency: Biennially

CONSENT: Superfund (CERCLA) Consent Decrees
Source: EPA Regional Offices
Telephone: Varies
Major legal settlements that establish responsibility and standards for cleanup at NPL (Superfund) sites. Released periodically by United States District Courts after settlement by parties to litigation matters.

Date of Government Version: N/A
Database Release Frequency: Varies

ROD: Records Of Decision
Source: EPA
Telephone: 703-416-0223
Record of Decision. ROD documents mandate a permanent remedy at an NPL (Superfund) site containing technical and health information to aid in the cleanup.
### GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

- **Date of Government Version:** 12/21/01  
  **Date of Last EDR Contact:** 01/07/03  
  **Date of Next Scheduled EDR Contact:** 04/07/03

#### DELISTED NPL: National Priority List Deletions

**Source:** EPA  
**Telephone:** N/A

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425(e), sites may be deleted from the NPL where no further response is appropriate.

#### NPL LIENS: Federal Superfund Liens

**Source:** EPA  
**Telephone:** 205-564-4267

Federal Superfund Liens. Under the authority granted the USEPA by the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner receives notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.
GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

Date of Government Version: 10/15/91
Database Release Frequency: No Update Planned

Date of Last EDR Contact: 11/25/02
Date of Next Scheduled EDR Contact: 02/24/03

PAADS: PCB Activity Database System
Source: EPA
Telephone: 202-564-3887
PCB Activity Database. PAADS identifies generators, transporters, commercial storers and/or brokers and disposers of PCB's who are required to notify the EPA of such activities.

Date of Government Version: 09/20/02
Database Release Frequency: Annually

Date of Last EDR Contact: 02/10/03
Date of Next Scheduled EDR Contact: 05/12/03

RAATS: RCRA Administrative Action Tracking System
Source: EPA
Telephone: 202-564-4104
RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

Date of Government Version: 04/17/95
Database Release Frequency: No Update Planned

Date of Last EDR Contact: 12/10/02
Date of Next Scheduled EDR Contact: 03/10/03

TRIS: Toxic Chemical Release Inventory System
Source: EPA
Telephone: 202-260-1531
Toxic Release Inventory System. TRIS identifies facilities which release toxic chemicals to the air, water and land in reportable quantities under SARA Title III Section 313.

Date of Government Version: 12/31/00
Database Release Frequency: Annually

Date of Last EDR Contact: 12/26/02
Date of Next Scheduled EDR Contact: 03/24/03

TSCA: Toxic Substances Control Act
Source: EPA
Telephone: 202-260-5521
Toxic Substances Control Act. TSCA identifies manufacturers and importers of chemical substances included on the TSCA Chemical Substance Inventory list. It includes data on the production volume of these substances by plant site.

Date of Government Version: 12/31/98
Database Release Frequency: Every 4 Years

Date of Last EDR Contact: 12/10/02
Date of Next Scheduled EDR Contact: 03/10/03

FTTS INSPI: FIFRA TSCA Tracking System - FIFRA (Federal Insecticide, Fungicide, & Rodenticide Act)/TSCA (Toxic Substances Control Act)
Source: EPA
Telephone: 202-564-2501

Date of Government Version: 10/24/02
Database Release Frequency: Quarterly

Date of Last EDR Contact: 12/26/02
Date of Next Scheduled EDR Contact: 03/24/03

SSTS: Section 7 Tracking Systems
Source: EPA
Telephone: 202-564-5008
Section 7 of the Federal Insecticide, Fungicide and Rodenticide Act, as amended (92 Stat. 829) requires all registered pesticide-producing establishments to submit a report to the Environmental Protection Agency by March 1st each year. Each establishment must report the types and amounts of pesticides, active ingredients and devices being produced, and those having been produced and sold or distributed in the past year.

Date of Government Version: 12/31/00
Database Release Frequency: Annually

Date of Last EDR Contact: 01/21/03
Date of Next Scheduled EDR Contact: 04/21/03
FTTS: FIFRA/ TSCA Tracking System - FIFRA (Federal Insecticide, Fungicide, & Rodenticide Act)/TSCA (Toxic Substances Control Act)
Source: EPA/Office of Prevention, Pesticides and Toxic Substances
Telephone: 202-564-2501
FTTS tracks administrative cases and pesticide enforcement actions and compliance activities related to FIFRA,
TSCA and EPCRA (Emergency Planning and Community Right-to-Know Act). To maintain currency, EDR contacts the
Agency on a quarterly basis.
Date of Government Version: 10/24/02
Date of Last EDR Contact: 12/26/02
Database Release Frequency: Quarterly
Date of Next Scheduled EDR Contact: 03/24/03

STATE OF NEW YORK ASTM STANDARD RECORDS

SHWS: Inactive Hazardous Waste Disposal Sites in New York State
Source: Department of Environmental Conservation
Telephone: 518-402-9553
State Hazardous Waste Sites. State hazardous waste site records are the states' equivalent to CERCLIS. These sites
may or may not already be listed on the federal CERCLIS list. Priority sites planned for cleanup using state funds
(state equivalent of Superfund) are identified along with sites where cleanup will be paid for by potentially
responsible parties. Available information varies by state.
Date of Government Version: 04/01/02
Date Made Active at EDR: 11/12/02
Date of Data Arrival at EDR: 10/22/02
Database Release Frequency: Annually
Elapsed ASTM days: 21
Date of Last EDR Contact: 11/25/02

SWF/LF: Facility Register
Source: Department of Environmental Conservation
Telephone: 518-457-2051
Solid Waste Facilities/Landfill Sites. SWF/LF type records typically contain an inventory of solid waste disposal
facilities or landfills in a particular state. Depending on the state, these may be active or inactive facilities
or open dumps that failed to meet RCRA Subtitle D Section 4004 criteria for solid waste landfills or disposal
sites.

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.
Oil/Gas Pipelines/Electrical Transmission Lines: This data was obtained by EDR from the USGS in 1994. It is referred to by USGS as GeoData Digital Line Graphs from 1:100,000-Scale Maps. It was extracted from the transportation category including some oil, but primarily gas pipelines and electrical transmission lines.

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

Flood Zone Data: This data, available in select counties across the country, was obtained by EDR in 1999 from the Federal Emergency Management Agency (FEMA). Data depicts 100-year and 500-year flood zones as defined by FEMA.

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002 from the U.S. Fish and Wildlife Service.

UTM Y (Meters): 4529657.5

EDR's GeoCheck Physical Setting Source Addendum has been developed to assist the environmental professional with the collection of physical setting source information in accordance with ASTM 1527-00, Section 7.2.3. Section 7.2.3 requires that a current USGS 7.5 Minute Topographic Map (or equivalent, such as the USGS Digital Elevation Model) be reviewed. It also requires that one or more additional physical setting sources be sought when (1) conditions have been identified in which hazardous substances or petroleum products are likely to migrate to or from the property, and (2) more information than is provided in the current USGS 7.5 Minute Topographic Map (or equivalent) is generally obtained, pursuant to local good commercial or customary practice, to assess the impact of migration of recognized environmental conditions in connection with the property. Such additional physical setting sources generally include information about the topographic, hydrologic, hydrogeologic, and geologic characteristics of a site, and wells in the area.

Assessment of the impact of contaminant migration generally has two principle investigative components:

1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata. EDR's GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.
GROUNDWATER FLOW DIRECTION INFORMATION
Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).

TOPOGRAPHIC INFORMATION
Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

USGS TOPOGRAPHIC MAP ASSOCIATED WITH THIS SITE
Target Property: 2440073-H7 MOUNT VERNON, NY
Source: USGS 7.5 min quad index

GENERAL TOPOGRAPHIC GRADIENT AT TARGET PROPERTY
Target Property: General ESE
Source: General Topographic Gradient has been determined from the USGS 1 Degree Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

HYDROLOGIC INFORMATION
Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

MOUNT VERNON
NWI Electronic Data Coverage
YES - refer to the Overview Map and Detail Map

HYDROGEOLOGIC INFORMATION
Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.
Site-Specific Hydrogeological Data:
Search Radius: 2.0 miles
Status: Not found

AQUIFLOW®
Search Radius: 2.000 Miles.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

<td>GROUNDWATER FLOW</td>
</tr>
</tbody>
</table>

GROUNDWATER FLOW VELOCITY INFORMATION
Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY
Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps. The following information is based on Soil Conservation Service STATSGO data.
GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

Soil Component Name: URBAN LAND
Soil Surface Texture: variable
Hydrologic Group: Not reported
Soil Drainage Class: Not reported
Hydric Status: Soil does not meet the requirements for a hydric soil.
Corrosion Potential - Uncoated Steel: Not Reported
Depth to Bedrock Min: > 10 inches
Depth to Bedrock Max: > 10 inches

OTHER SOIL TYPES IN AREA

Based on Soil Conservation Service Statistics data, the following additional subordinate soil types may appear within the general area of target property.

Soil Surface Textures: fine sandy loam
Surficial Soil Types: fine sandy loam
Shallow Soil Types: No Other Soil Types
Deeper Soil Types: unweathered bedrock
stratified
gravelly - fine sandy loam
fine sandy loam

ADDITIONAL ENVIRONMENTAL RECORD SOURCES

According to ASTM E 1527-00, Section 7.2.2, "one or more additional state or local sources of environmental records may be checked, in the discretion of the environmental professional, to enhance and supplement federal and state sources... Factors to consider in determining which local or additional state records, if any, should be checked include (1) whether they are reasonably ascertainable, (2) whether they are sufficiently useful, accurate, and complete in light of the objective of the records review (see 7.1.1), and (3) whether they are obtained, pursuant to local, good commercial or customary practice." One of the record sources listed in Section 7.2.2 is water well information. Water well information can be used to assist the environmental professional in assessing sources that may impact groundwater flow direction, and in forming an opinion about the impact of contaminant migration on nearby drinking water wells.

HYDROLOGIC INFORMATION

**Flood Zone Data:** This data, available in select counties across the country, was obtained by EDR in 1999 from the Federal Emergency Management Agency (FEMA). Data depicts 100-year and 500-year flood zones as defined by FEMA.

**NWRI:** National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002 from the U.S. Fish and Wildlife Service.

HYDROGEOLOGIC INFORMATION

**AQUIFLOW** Information System
Source: EDR proprietary database of groundwater flow information
EDR has developed the AQUIFLOW Information System (AIS) to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted to regulatory authorities at select sites and has extracted the date of the report, hydrogeologically determined groundwater flow direction and depth to water table information.

GEOLOGIC INFORMATION

**Geologic Age and Rock Stratigraphic Unit**

**STATSGO:** State Soil Geographic Database
The U.S. Department of Agriculture’s (USDA) Soil Conservation Service (SCS) leads the national Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

ADDITIONAL ENVIRONMENTAL RECORD SOURCES

FEDERAL WATER WELLS

**PWS:** Public Water Systems
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Public Water System data from the Federal Reporting Data System. A PWS is any water system which provides water to at least 25 people for at least 60 days annually. PWSs provide water from wells, rivers and other sources.

**PWS ENF:** Public Water Systems Violation and Enforcement Data
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750

**USGS Water Wells:** In November 1971 the United States Geological Survey (USGS) implemented a national water resource information tracking system. This database contains descriptive information on sites where the USGS collects or has collected data on surface water and/or groundwater. The groundwater data includes information on more than 900,000 wells, springs, and other sources of groundwater.
TABLE OF CONTENTS

The EDR-Site Report™ is a comprehensive presentation of government filings on a facility identified in a search of over 4 million government records from more than 600 federal, state and local environmental databases. The report is divided into three sections:

Section 1: Facility Summary ........................................ Page 3

Summary of facility filings including a review of the following areas: waste management, waste disposal, multi-media issues, and Superfund liability.

Section 2: Facility Detail Reports ...................................... Page 4

All available detailed information from databases where sites are identified.

Section 3: Databases Searched and Update Information. ........... Page 5

Name, source, update dates, contact phone number and description of each of the databases searched for this report.

Thank you for your business.
Please contact EDR at 1-800-352-0050
with any questions or comments.

WASTE MANAGEMENT

Facility manages registered aboveground storage tanks

DATABASE: Aboveground Storage Tank Database (AST)

NEW ROCHELLE ARMORY
270 EAST MAIN ST.
NEW ROCHELLE, NY 00000
EDR ID #A100213272

AST Westchester County:
Facility ID: 6828
Tank Number: ARM1
Tank Location: Aboveground
Tank Status: In Service
Install Date: Not reported
Contents: Nos. 1, 2 or 4 Fuel Oil
Tank Type: 0
SECTION 3: DATABASES SEARCHED AND UPDATE DATES

To maintain currency of the following federal, state and local databases, EDR contacts the appropriate government agency on a monthly or quarterly basis as required.

Elapsed ASTM days: Provides confirmation that this report meets or exceeds the 90-day updating requirement of the ASTM standard.

WASTE MANAGEMENT

RCRIS: Resource Conservation and Recovery Information System
Source: EPA/NTIS
Telephone: 800-424-9346
Resource Conservation and Recovery Information System. RCRIS includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA).

Date of Government Version: 09/09/2002
Database Release Frequency: Varies
Date of Last EDR Contact: 12/26/2002
Date of Next Scheduled Update: 03/24/2003

BRS: Biennial Reporting System
Source: EPA/NTIS
Telephone: 800-424-9346
The Biennial Reporting System is a national system administered by the EPA that collects data on the generation and management of hazardous waste. BRS captures detailed data from two groups: Large Quantity Generators (LQG) and Treatment, Storage, and Disposal Facilities.

Date of Government Version: 12/31/1999
Database Release Frequency: Biennially
Date of Last EDR Contact: 12/17/2002
Date of Next Scheduled Update: 03/17/2003

RAATS: RCRA Administrative Action Tracking System
Source: EPA
Telephone: 202-584-4104
RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

Date of Government Version: 04/17/1995
Database Release Frequency: No Update Planned
Date of Last EDR Contact: 12/10/2002
Date of Next Scheduled Update: 03/10/2003

CORRACTS: Corrective Action Report
Source: EPA
Telephone: 800-424-9346
CORRACTS identifies hazardous waste handlers with RCRA corrective action activity.

Date of Government Version: 01/15/2003
Database Release Frequency: Semi-Annually
Date of Last EDR Contact: 12/09/2002
Date of Next Scheduled Update: 03/10/2003

PADS: PCB Activity Database System
Source: EPA
Telephone: 202-564-3887
PCB Activity Database. PADS identifies generators, transporters, commercial storers and/or brokers and disposers of PCB's who are required to notify the EPA of such activities.

Date of Government Version: 09/20/2002
Database Release Frequency: Annually
Date of Last EDR Contact: 02/10/2003
Date of Next Scheduled Update: 05/12/2003

MLTS: Material Licensing Tracking System
Source: Nuclear Regulatory Commission
Telephone: 301-415-7169
MLTS is maintained by the Nuclear Regulatory Commission and contains a list of approximately 8,100 sites which possess or use radioactive materials and which are subject to NRC licensing requirements. To maintain currency, EDR contacts the Agency on a quarterly basis.

Date of Government Version: 01/16/2003
Database Release Frequency: Quarterly
Date of Last EDR Contact: 01/06/2003
Date of Next Scheduled Update: 04/07/2003
SECTION 3: DATABASES SEARCHED AND UPDATE DATES
...Continued...

NY AST: Petroleum Bulk Storage
Source: Department of Environmental Conservation,
Telephone: 518-402-9549
Registered Aboveground Storage Tanks.

Date of Government Version: 01/01/2002  Date of Last EDR Contact: 01/28/2003
Database Release Frequency: Varies     Date of Next Scheduled Update: 04/28/2003

NY UST: Petroleum Bulk Storage (PBS) Database
Source: Department of Environmental Conservation
Telephone: 518-402-9549
Facilities that have petroleum storage capacities in excess of 1,100 gallons and less than 400,000
gallons.

Date of Government Version: 01/01/2002  Date of Last EDR Contact: 01/28/2003
Database Release Frequency: Varies     Date of Next Scheduled Update: 04/28/2003

ERNS: Emergency Response Notification System
Source: National Response Center, United States Coast Guard
Telephone: 202-260-2342
Emergency Response Notification System. ERNS records and stores information on reported releases of
oil and hazardous substances.

Date of Government Version: 12/31/2001  Date of Last EDR Contact: 01/27/2003
Database Release Frequency: Annually     Date of Next Scheduled Update: 04/28/2003

HMIRS: Hazardous Materials Information Reporting System
Source: U.S. Department of Transportation
Telephone: 202-366-4555
Hazardous Materials Incident Report System. HMIRS contains hazardous material spill incidents reported
to DOT.

Date of Government Version: 11/30/2002  Date of Last EDR Contact: 01/23/2003
Database Release Frequency: Annually     Date of Next Scheduled Update: 04/21/2003

WASTE DISPOSAL

NPL: National Priority List
Source: EPA
Telephone: Not reported
National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites
for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As
such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental
Photographic Interpretation Center (EPIC) and regional EPA offices.

Date of Government Version: 01/29/2003  Date of Data Arrival at EDR: 02/04/2003
Date Made Active at EDR: 03/04/2003 Elapsed ASTM Days: 28
Database Release Frequency: Semi-Annually     Date of Last EDR Contact: 02/04/2003

PROPOSED NPL: Proposed National Priority List Sites
Source: EPA
Telephone: Not reported

Date of Government Version: 01/29/2003  Date of Data Arrival at EDR: 02/04/2003
Date Made Active at EDR: 03/04/2003 Elapsed ASTM Days: 28
Database Release Frequency: Semi-Annually     Date of Last EDR Contact: 02/04/2003

DELISTED NPL: National Priority List Deletions
Source: EPA
Telephone: Not reported
The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria
that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425(e), sites may
be deleted from the NPL where no further response is appropriate.

Date of Government Version: 01/29/2003  Date of Data Arrival at EDR: 02/04/2003
Date Made Active at EDR: 03/04/2003 Elapsed ASTM Days: 28
Database Release Frequency: Quarterly     Elapsed ASTM Contact: 02/04/2003

SECTION 3: DATABASES SEARCHED AND UPDATE DATES

...Continued...

CERCLIS: Comprehensive Environmental Response, Compensation, and Liability Information System
Source: EPA
Telephone: 703-413-0223
CERCLIS contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). CERCLIS contains sites which are either proposed to or on the National Priorities List (NPL) and sites which are in the screening and assessment phase for possible inclusion on the NPL.

Date of Government Version: 12/13/2002
Date Made Active at EDR: 01/15/2003
Database Release Frequency: Quarterly
Date of Data Arrival at EDR: 12/26/2002
Elapsed ASTM Days: 20
Date of Last EDR Contact: 12/26/2002

CERCLIS-NFRAP: CERCLIS No Further Remedial Action Planned
Source: EPA
Telephone: 703-413-0223
As of February 1995, CERCLIS sites designated "No Further Remedial Action Planned" (NFRAP) have been removed from CERCLIS. NFRAP sites may be sites where, following an initial investigation, no contamination was found, contamination was removed quickly without the need for the site to be placed on the NPL, or the contamination was not serious enough to require Federal Superfund action or NPL consideration. EPA has removed approximately 25,000 NFRAP sites to lift the unintended barriers to the redevelopment of these properties and has archived them as historical records so EPA does not needlessly repeat the investigations in the future. This policy change is part of the EPA's Brownfields Redevelopment Program to help cities, states, private investors and affected citizens to promote economic redevelopment of unproductive urban sites.

Date of Government Version: 12/13/2002
Database Release Frequency: Quarterly
Date of Last EDR Contact: 12/26/2002
Date of Next Scheduled Update: 03/24/2003

NPL LIENS: Federal Superfund Liens
Source: EPA
Telephone: 205-564-4287
Federal Superfund Liens. Under the authority granted the USEPA by the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner receives notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

Date of Government Version: 10/15/1991
Date Made Active at EDR: 03/30/1994
Database Release Frequency: No Update Planned
Date of Data Arrival at EDR: 02/02/1994
Elapsed ASTM Days: 56
Date of Last EDR Contact: 02/27/2003

NY SWHWS: Inactive Hazardous Waste Disposal Sites in New York State
Source: Department of Environmental Conservation
Telephone: 518-402-9553
State Hazardous Waste Sites. State hazardouus waste site records are the state's equivalent to CERCLIS. These sites may or may not already be listed on the federal CERCLIS list. Priority sites planned for cleanup using state funds (state equivalent of Superfund) are identified along with sites where cleanup will be paid for by potentially responsible parties. Available information varies by state.

Date of Government Version: 04/01/2002
Database Release Frequency: Annually
Date of Last EDR Contact: 02/24/2003
Date of Next Scheduled Update: 05/26/2003

NY SWF/LF: Facility Register
Source: Department of Environmental Conservation
Telephone: 518-457-2051
Solid Waste Facilities/Landfill Sites. SWF/LF type records typically contain an inventory of solid waste disposal facilities or landfills in a particular state. Depending on the state, these may be active or inactive facilities or open dumps that failed to meet RCRA Subtitle D Section 4004 criteria for solid waste landfills or disposal sites.

Date of Government Version: 12/31/2001
Database Release Frequency: Semi-Annually
Date of Last EDR Contact: 02/03/2003
Date of Next Scheduled Update: 05/05/2003
SECTION 3: DATABASES SEARCHED AND UPDATE DATES

MULTIMEDIA

TRIS: Toxic Chemical Release Inventory System
Source: EPA
Telephone: 202-280-1531
Toxic Release Inventory System. TRIS identifies facilities which release toxic chemicals to the air, water and land in reportable quantities under SARA Title III Section 313.

Date of Government Version: 12/31/2000
Date of Last EDR Contact: 12/26/2002
Date of Next Scheduled Update: 03/24/2003

Database Release Frequency: Annually

SSTS: Section 7 Tracking Systems
Source: EPA
Telephone: 202-564-6008
Section 7 of the Federal Insecticide, Fungicide and Rodenticide Act, as amended (92 Stat. 829) requires all registered pesticide-producing establishments to submit a report to the Environmental Protection Agency by March 1st each year. Each establishment must report the types and amounts of pesticides, active ingredients and devices being produced, and those having been produced and sold or distributed in the past year.

Date of Government Version: 12/31/2000
Date of Last EDR Contact: 01/21/2003
Date of Next Scheduled Update: 04/21/2003

Database Release Frequency: Annually

TSCA: Toxic Substances Control Act
Source: EPA
Telephone: 202-280-5521
Toxic Substances Control Act. TSCA identifies manufacturers and importers of chemical substances included on the TSCA Chemical Substance Inventory List. It includes data on the production volume of these substances by plant site.

Date of Government Version: 12/31/1998
Date of Last EDR Contact: 12/10/2002
Date of Next Scheduled Update: 03/10/2003

Database Release Frequency: N/A

FTTS: FIFRA/ TSCA Tracking System - FIFRA (Federal Insecticide, Fungicide, & Rodenticide Act)/TSCA (Toxic Substances Control Act)
Source: EPA/Office of Prevention, Pesticides and Toxic Substances
Telephone: 202-564-2501
FTTS tracks administrative cases and pesticide enforcement actions and compliance activities related to FIFRA, TSCA and EPCRA (Emergency Planning and Community Right-to-Know Act). To maintain currency, EDR contacts the Agency on a quarterly basis.

Date of Government Version: 10/24/2002
Date of Last EDR Contact: 12/26/2002
Date of Next Scheduled Update: 03/24/2003

Database Release Frequency: Quarterly

FTTS INSPI: FIFRA/ TSCA Tracking System - FIFRA (Federal Insecticide, Fungicide, & Rodenticide Act)/TSCA (Toxic Substances Control Act)
Source: EPA
Telephone: 202-564-2501

Date of Government Version: 10/24/2002
Date of Last EDR Contact: 12/26/2002
Date of Next Scheduled Update: 03/24/2003

Database Release Frequency: Quarterly

FINDS: Facility Index System/Facility Identification Initiative Program Summary Report
Source: EPA
Telephone: Not reported
Facility Index System. FINDS contains both facility information and 'pointers' to other sources that contain more detail. EDR includes the following FINDS databases in this report: PCS (Permit Compliance System), AIRS (Aerometric Information Retrieval System), DOCKET (Enforcement Docket used to manage and track information on civil judicial enforcement cases for all environmental statutes), FURS (Federal Underground Injection Control), C-DOCKET (Criminal Docket System used to track criminal enforcement actions for all environmental statutes), PFIS (Federal Facilities Information System), STATE (State Environmental Laws and Statutes), and PADS (PCB Activity Data System).

Date of Government Version: 01/14/2003
Date of Last EDR Contact: 01/06/2003
Date of Next Scheduled Update: 04/07/2003

Database Release Frequency: Quarterly
SECTION 3: DATABASES SEARCHED AND UPDATE DATES...

NY LTANKS: Spills Information Database
Source: Department of Environmental Conservation
Telephone: 518-402-9549
Leaking Storage Tank Incident Reports. These records contain an inventory of reported leaking storage tank incidents reported from 4/1/86 through the most recent update. They can be either leaking underground storage tanks or leaking aboveground storage tanks. The causes of the incidents are tank test failures, tank failures or tank overfills.

Date of Government Version: 01/01/2002

FREEDOM OF INFORMATION ACT RESPONSE LETTERS
February 27, 2003

Foster Wheeler Environmental Corporation
1000 The American Road
Morris Plains, NJ 07950
Att: Richard Delahunty

Re: Freedom of Information
Request No. 0114
Brownfields Assessment
Armory
270 Main Street.
New Rochelle, NY 10801

Dear Mr. Delahunty:

This is to acknowledge the receipt of your Freedom of Information request dated February 24, 2003 which was received in this office on February 27, 2003. Your request has been forwarded to the appropriate staff for response; it is anticipated that you will have a response to your request by March 20, 2003.

If you need to communicate with us in the future, please use the “Request Number indicated above. Thank you.

Sincerely,

Mary Landrigan
Freedom of Information Officer

Morris Plains, NJ 07950

RE: Freedom of Information Act (FOIA), 5 U.S.C. 552  
Request No. 02-RIN-00889-03

Dear Mr. Delahunty:

Thank you for your FOIA request, dated February 24, 2003, and received in this office on February 27, 2003, for records related to THE ARMORY  
270 MAIN STREET  
NEW ROCHELLE, NY 10801. The Agency has twenty (20) working days to respond to your request, except when you have agreed to an alternate due date or unusual circumstances exist that would require an extension of time under 5 U.S.C. 552(a)(6)(B). Please be advised that in accordance with the EPA's revised FOIA regulations (40 CFR 2.100, et. seq.), effective November 5, 2002, the Agency's fees for processing requests have changed. The new fee schedule is as follows:

- Clerical staff time billed at $4.00 per 15 minutes of search and/or review  
- Professional staff time billed at $7.00 per 15 minutes of search and/or review  
- Managers' time billed at $10.25 per 15 minutes of search and/or review  
- No fee will be charged for services at or below $14.00  
- Assurance of payment of fees above $25.00 will be obtained from the requester before commencing any work  
- Advance payment of fees above $250 may be required by the Agency before commencing any work

We hope to respond to you soon. In the interim, please contact us if you have any questions about your request. Please cite your FOIA request number in all communications.

Sincerely,

Freedom of Information Officer - Public Affairs Division  
Office: (212)637-3668  
Fax: (212)637-5046
Dear Mr. Delahunty:

This is to acknowledge receipt of your Freedom of Information Law request seeking:

Records re: Armory at 270 Main Street, New Rochelle

I have referred your request to the following Records Custodian (s) / Freedom of Information Law Coordinator (s) who may possess the records you are requesting:

Ms. Antoinette Norfleet - Environmental Remediation
625 Broadway
Albany, NY 12233-7012 (518) 402-9750

Mr. Michael Knipfing - Region 3
21 South Putt Corners Road
New Paltz, NY 12561-1696 (845) 256-3052

You may expect a response to your request by 3/20/03.

If I can be of further assistance, please contact me at (518) 402-8000 Refer to request number 03-238 if you write or call.

Sincerely,

Ruth L. Earl
Records Access Officer

EXECUTIVE SUMMARY

Foster Wheeler Environmental Corporation (Foster Wheeler Environmental) is submitting this Brownfields Site Background Memorandum for the New Rochelle City Yard Property (City Yard property) to the United States Environmental Protection Agency (EPA), in response to EPA Work Assignment Number 039-SISI-02ZZ issued under EPA RAC II Contract Number 68-W-98-214. This report is based upon, and is consistent with EPA guidance.

The 6.47-acre property is located at 224 East Main Street, New Rochelle, New York and is identified as Block 84 Lot 5. The area is currently zoned M-1 and M-3, which is identified as light and heavy manufacturing, respectively. The City Yard property is currently occupied by the City of New Rochelle’s Department of Public Works. Structures on the property include six separate one-story structures of various construction types and materials. These buildings are used as a Carpentry Shop, Sewers & Drains, Streets and Highways, and Sanitation Building, Compost Building, Machinery/Car Storage, Repair Garage and Bookmobile Storage Building.

The City Yard property is contiguous to Echo Bay of the Long Island Sound and is located within the Westchester County Designated Long Island Sound Critical Area. The topography of the property slopes gently to the southeast with elevations ranging from 0 to 30 feet above mean sea level (msl). The portion of the property contiguous to Echo Bay, approximately 25 percent of the property, occurs within the 100-year floodplain. Areas of minimal flooding comprise approximately 25 percent of the property. The remaining 50 percent of the subject property occurs within the 500-year floodplain. The property soils are identified as Urban land where at least 60 percent of the land surface is covered with buildings or other structures. Estuarine Non-Vegetated (E1UBL) wetlands are identified by the National Wetland Inventory (NWI) as occurring along the eastern and southern edges of the subject property.

Three well databases (Federal USGS, Federal FRDS Public Water Supply (PWS), and State Database) were searched by Environmental Data Resources, Inc. (EDR) for the occurrence of potable water wells within a one-mile radius of the property. Six Federal USGS wells and one Federal FRDS PWS well are located within one mile of the City Yard property. One of the Federal USGS wells was identified as unused. The primary uses of water for the remaining wells include commercial (three wells) and industrial (two wells). The PWS well currently has or had major violation(s) or enforcement actions. Information regarding the direction of groundwater flow was not provided by EDR.

Foster Wheeler Environmental’s investigation identified the following areas of concern and associated recommendations.

- **Groundwater and Soil Investigation** – A 2,000-gallon gasoline underground storage tank (UST) failed at the facility. A groundwater and soil investigation concluded that dissolved and adsorbed benzene, toluene, ethylbenzene, and xylene (BTEX) compounds were present in the soils and groundwater beneath the property. The City of New Rochelle is undertaking the design and construction of a remediation system at the site.
- **Consolidated Edison property** – A former Consolidated Edison substation was located on Echo Avenue between 0.125 and 0.25 miles to the southwest of the City Yard. Cleanup activities to remove polychlorinated biphenyls (PCB) contaminated soil and sediment from the Consolidated Edison property, adjacent commercial and residential properties and the Echo Bay tidal lands are almost complete. It is recommended that soil and sediment samples be collected from the southern portion of the City Yard along Echo Bay and analyzed for PCBs.

- **Spills** – Seven spills were reported to have occurred at the City Yard facility. It is recommended that information regarding City Yard property spills be reviewed as part of the ongoing site investigation and that soil and groundwater sampling be performed in the vicinity of the identified spills to evaluate potential subsurface impacts.

- **USTs** - Up to 12 USTs may be present at the site. It is recommended that the locations of all in-use and former USTs at the City Yard facility be determined and any UST closure reports and tank test reports be obtained. It is also recommended that soil and groundwater sampling be performed in the vicinity of the former USTs.

- **ASTs** – Three in-service Aboveground Storage Tanks (ASTs) are reported to be present at the facility. If stained areas are observed in the vicinity of the ASTs during the site inspection, soil sampling should be performed in the stained areas to determine if any environmental impacts have resulted from the ASTs.

- **Site History** – The reported appearance of the soils in topographic lows, especially where pavement is absent, and the historic use of the site for the storage and maintenance of vehicles suggest the possibility of a buildup of petroleum hydrocarbons and other contaminants in soils in localized areas. If stained areas are observed during the site inspection, soil sampling should be performed.

- **Transformer** – One transformer was reported to be present between the Automotive Repair Garage and the Vehicle Storage Garage. If stained areas are observed in the vicinity of the identified transformer or additional transformers are found during the site inspection, soil sampling is recommended to be performed.

- **Lead-Based Paint and Asbestos Containing Building Material (ACBM)** – Due to the age of the buildings at the facility, the possibility of the presence of lead-based paint and ACBM in the structures exists. If suspect material is observed during the site inspection, then sampling of the material should be performed to assess the possible presence of lead-based paint and/or asbestos.

- **Drains** – If it is determined that floor drains are present within the facility’s structures, the discharge points should be identified and samples should be collected in the drain and at the discharge location, if possible.

- **Non-native Fill** – The City Yard property was expanded into Echo Bay through the use of fill material of unknown origin. Therefore, sampling of the material is recommended to determine if any environmental impacts have resulted from the introduction of this material to the site.
1.0 INTRODUCTION

The City of New Rochelle, Westchester County, New York proposes to construct a mixed-use residential waterfront community on lands contiguous to Echo Bay. The project will expand across several City-owned properties including the New Rochelle City Yard (City Yard property). Usage of the proposed community will include approximately 336,300 square feet residential, 32,500 square feet commercial/office, and 24,000 square feet specialty retail. The proposed project will also improve public access to Echo Bay.

This Draft Brownfields Site Background Memorandum presents the findings of a background investigation of the 6.47-acre City Yard property. Foster Wheeler Environmental Corporation (Foster Wheeler Environmental) conducted this assessment in response to the United States Environmental Protection Agency (EPA) Work Assignment Number 039-SISI-02ZZ issued under EPA RAC II Contract Number 68-W-98-214. This report is based upon, and is consistent with EPA guidance for completion of a Preliminary Site Assessment.

1.1 Objectives

The goal of the Brownfields Site Inspections (BSIs) being performed under this Work Assignment is to provide a detailed characterization of environmental conditions at Brownfields Sites that have redevelopment potential. The four primary objectives of the BSIs are:

- Determine the nature and extent of contamination on the site;
- Determine the risks posed by the contamination;
- Determine the potential remedial alternatives to minimize continued risks to human health and/or the environment; and
- Estimate costs of identified cleanup options in the scope of site redevelopment.

The first phase of the BSI is a background investigation, which is the subject of this report. Foster Wheeler Environmental performed a review of background information of the City Yard property in New Rochelle, New York in order to obtain information on environmental issues related to past and current use of the site to assist EPA in identifying the possibility of recognized environmental conditions.

1.2 Scope of Work

The following tasks were included in preparing the Brownfields Site Background Memorandum for the City Yard site:
Task 1: Evaluate Existing Data and Documents

In order to identify existing environmental conditions at the site, and determine whether contamination has been previously documented for the site, Foster Wheeler Environmental performed an evaluation of existing, available files and documents. Foster Wheeler Environmental obtained and reviewed existing background information, including: Sanborn fire insurance maps, aerial photographs, US Department of the Interior, Geological Survey (USGS) Topographic maps, United States Fish and Wildlife Service (USFWS) National Wetland Inventory (NWI) maps, New York State Department of Conservation (NYSDEC) wetlands maps, tidal wetlands maps, the county soil survey, and Federal Emergency Management Agency (FEMA) Flood Insurance Rate Maps (FIRM). In addition, Freedom of Information Act (FOIA) letters were submitted to the relevant regulatory agencies requesting a review of all files pertaining to the City Yard property.

Task 2: Environmental Regulatory Database Search

Foster Wheeler Environmental obtained a commercially available database report of a search of federal and state regulatory databases to determine the possible presence of hazardous substance or petroleum products at the City Yard property or within the proximity of the property.

Task 3: Conduct Select Interviews

Interviews were conducted with property owners and occupants of the site. As the property was owned and operated by the City of New Rochelle, interviews were restricted to City personnel. Site visits were not included in this phase of work; therefore, interviews were conducted with Planning Department and Department of Public Works (DPW) personnel at the City office and did not include site personnel. Any pertinent files or contacts associated with the City Yard property were obtained during the interviews.

Task 4: Prepare Brownfields Site Background Memorandum

This Brownfields Site Background Memorandum summarizes general site characteristics, including current and historical site use, geology, hydrology, and the presence of surface water features. In addition, a summary of potential and/or known environmental concerns was documented, and an inventory of water supply wells (public or private) within one mile of the subject property was compiled.

1.3 Special Terms and Conditions

Foster Wheeler Environmental’s assessment represents a review of certain information relating to the property that was obtained by methods described above and did not include a site visit, sampling or other monitoring activities at the property. While Foster Wheeler Environmental has used reasonable care to avoid reliance upon data and information that is inaccurate, Foster Wheeler Environmental is not able to verify the accuracy or completeness of all data and information available during the investigation and some of the conclusions would be different if the information upon which they are based is determined to be false, inaccurate, or incomplete. Foster Wheeler Environmental makes no legal representations whatsoever concerning any matter, including, but not limited to, ownership of any property or the interpretation of any law. Foster Wheeler
Environmental further disclaims any obligation to update the report for events taking place after the time during which the assessment was conducted.

1.4 Limiting Conditions

A site reconnaissance was not included in the scope of work for this portion of the project. Therefore, data pertinent to performing an accurate evaluation of the environmental conditions of the property (i.e., staining, material storage practices, presence of asbestos, lead-based paint, tanks and floor drains, and interviews with site personnel) are absent. In addition, all data presented in the report are provided without the benefit of verifying the information in the field.
2.0 SITE DESCRIPTION

The information in this section was obtained from select interviews and a records review. A list of the documents reviewed during the preparation of this Brownfields Site Background Memorandum is provided in Section 6.0.

2.1 Site Location and Legal Description

The City Yard property is located at 224 East Main Street in New Rochelle, Westchester County, New York 10801 and is listed as Section 1 Block 84 Lot 5 in the records of the Bureau of Buildings. Alternate mailing addresses (220 and 229 Main Street) are provided in the Environmental Site Assessment Report prepared by Environmental Data Resources, Inc. (EDR), and in the Phase I Environmental Site Assessment (ESA) prepared by Hill International, Inc. (HILL) in 1994. The EDR report is discussed in Section 3.1 and the 1994 Phase I ESA prepared by HILL is discussed in Section 3.2. Copies of the EDR Report and HILL's Phase I ESA are provided in Appendices A and B, respectively. The location of the Site is shown on Figure 1, Site Location Plan.

2.2 Site and Vicinity Characteristics

The City Yard property lies between Main Street and Echo Bay of the Long Island Sound and houses the City of New Rochelle's Department of Public Works (DPW). The majority of the property is developed and occupied by buildings, storage structures and material storage, and parking and driveway areas. The property is an irregular shaped 6.47-acre parcel of land and is bound by Main Street to the north, a commercial property and Echo Bay to the east, Echo Bay to the south, and the City Armory property to the west. The area is currently zoned M-1 and M-3, which is identified as light and heavy manufacturing, respectively. Based on a windshield observation of the site vicinity, a garden center and a concrete plant are located to the west of the site on Huntington Place. Mixed commercial properties including restaurants, delicatessens, car dealers and small retail shops, line Main Street in the vicinity of the site. Residential properties dominate the secondary streets.
2.3 Site Improvements

Based on information provided in HILL’s 1994 Phase I ESA, and obtained from interviews with City personnel, structures currently occupying the property include six separate one-story buildings of various construction (total area of 53,717 square feet). These buildings are currently used as a Carpentry Shop; Sewers & Drains, Streets and Highways, and Sanitation Building; Compost Building; Machinery/Car Storage; Repair Garage; and Bookmobile Storage Building. The following is a description of the City Yard property buildings:

- Carpentry Shop – A one-story brick and wood building, 30 feet by 35 feet in size, constructed in 1917.

- Sewers & Drains, Streets and Highways, and Sanitation Building – A long, segmented, one-story, L-shaped building constructed of brick and wood. The building consists mainly of nine sections built at different times. Two sections were built in 1917 and are 30 feet by 35 feet and 23 feet by 56 feet in size; three sections were constructed around 1919 and are 21 feet by 23 feet, 23 feet by 53 feet, and 20 feet by 23 feet in size; and, two sections were constructed in 1926, one is approximately 76 feet by 41 feet in size and the other structure’s size is unknown. The two remaining portions of the L-shaped building were built in 1950 and 1953. The size of these two small additions could not be determined.

- Compost Building – A one-story structure with a field stone basement, 30 feet by 60 feet in size, built in 1926.

- Machinery/Car Storage – A one-story steel truss and fieldstone building, 120 feet by 142 feet in size, built in 1937.

- Repair Garage with Fuel Pump Island – A one-story steel structure, 163 feet by 129 feet in size, constructed in 1969.

- Bookmobile Storage Building – A one-story cinder block building, 17 feet by 44 feet in size, built in 1958.

Other site structures include:

- Wood bins for the storage of road salt, sand and gravel;
- Concrete block wall for retaining recyclables on transfer floor;
- Vehicle wash station with water tank;
- Liquid salt tank; and
- Four concrete sewer structures included in the sewer main system passing through the property.

Two 10 foot wide and one 20 foot wide sanitary sewer easements bisect the property. Open areas are either bare soil or covered with asphalt or bluestone. The site is fenced along the northern and eastern boundaries and a dry stone retaining wall is present along the western edge. The site layout is provided in Figure 2, Site Layout Plan.
2.4  Current Uses of the Property

As previously stated, the City Yard property is owned by the City of New Rochelle and is occupied by the City of New Rochelle’s DPW. Based on information provided in HILL’s 1994 Phase I ESA, and obtained from interviews with City personnel, uses of the property include parking, maintenance, washing, fueling, and repair of City vehicles (except those of the Fire Department), and as offices and a staging area for the DPW’s activities. It is also used as a transfer station for recyclables and salt and sand storage. In addition, as identified in the previous section, several sanitary sewer easements bisect the property.

2.5  Past Uses of the Property

Based on information provided in HILL’s 1994 Phase I ESA, and obtained from interviews with City personnel, the City has owned the City Yard property since at least 1917. The property has been used since that time by the DPW. Sanborn fire insurance maps and information provided by the City indicate there were formerly additional structures present at the facility, and existing structures were used for different tasks than those of present day. A sewage disposal plant was formerly operated at the facility. The plant was constructed in 1926 and razed in 1970. It was located to the east of the steel garage constructed in 1969, the southern portion of the plant being where the covered fuel pump island is currently located. A metal garage constructed in 1952 was located between the sand and salt storage and the vehicle storage garage built in 1937.

HILL indicated an icehouse was present on the subject property in 1867 and the site had a sewer right of way since at least 1911. According to the Sanborn maps, four structures were located on the site in 1911, two unnamed, one labeled Boat Shop and the other labeled “portal.” An underground structure is also located less than 50 feet south of the Boat Shop. In addition, the northeastern edge of the site is identified as Stonbergs Boat Yard. By 1931 the Boat Shop and underground structure had been removed from the northeast portion of the site. The building labeled “portal” was removed prior to 1931, and the two remaining unnamed structures, located along the western edge of the property, were removed some time prior to 1951. Two additional buildings were formerly attached to the southern end of the segmented building. The two garage structures were constructed in 1919 and 1924 and were 30 feet by 35 feet and 35 feet by 40 feet in size. The majority of the segmented structure was formerly used as a garage. The building currently used as a carpentry shop was formerly used as a garage. In addition, the structure originally extended to the northeast where the main entrance to the facility is currently located.

2.6  Current and Past Uses of Adjoining Property

The subject property is bordered by Main Street to the north, a commercial property and Echo Bay to the east, Echo Bay to the south, and the City-owned Armory property to the east. According to City personnel, the Armory property was deeded to the Naval Militia in two parcels in 1930 and 1933 from the City of New Rochelle. Prior to that time the property was residential. According to the Sanborn fire insurance maps, an unoccupied structure was present on the commercial property to the east of the property in 1911. Uses of the property since that time appear to be predominantly automotive repair.
3.0 RECORDS AND DATA REVIEW

3.1 Regulatory Agency Database Search

This section of the report is a compilation of Federal, State, and local environmental databases. This information is as current as the most recently updated database. However, due to the dynamic nature of environmental laws and data reporting, this information will change over time.

A search of available environmental records was performed by EDR, and a report was issued to Foster Wheeler Environmental on 21 February 2003. Foster Wheeler Environmental did not participate in the research or compilation of the records report. A copy of this report is provided in Appendix A. Databases reviewed for the subject and surrounding properties, and the associated search radii include:

- **NPL - National Priority List.** The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. This database was last issued on October 24, 2002, and the search distance was one mile.

- **Proposed NPL – Proposed National Priority List Sites.** The source of this database is the EPA. The latest version of this database was issued on October 24, 2002, and the search distance was one mile.

- **CERCLIS - Comprehensive Environmental Response, Compensation, and Liability Information System.** CERCLIS contains data on potentially hazardous waste sites that have been reported to the EPA by states, municipalities, private companies, and private persons pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). CERCLIS contains sites that either are proposed to or are on the NPL and sites that are in the screening and assessment phase for possible inclusion on the NPL. This database was last issued on 13 December 2002, and the search distance was 0.5 mile.

- **CERCLIS-NFRAP – CERCLIS No Further Remedial Action Planned.** As of February 1995, CERCLIS sites designated "No Further Remedial Action Planned" (NFRAP) have been removed from CERCLIS. NFRAP sites may be sites where, following an initial investigation, no contamination was found, contamination was removed quickly without the need for the site to be placed on the NPL, or the contamination was not serious to require Federal Superfund action or NPL consideration. The source for this data is the EPA. This database was last issued on 13 December 2002, and the search distance was 0.25 mile.

- **CORRACTS - Corrective Action Report.** CORRACTS identifies hazardous waste handlers with Resource Conservation and Recovery Act (RCRA) corrective action activity. This database was last issued on 29 September 2002, and the search distance was 1 mile.

- **RCRIS - Resource Conservation and Recovery Information System.** RCRIS includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the RCRA. The EPA and the United States Department of Commerce, National Technical Information Service (NTIS) are the source of this database.
This database was last issued on September 9, 2002, and the search distance was 0.25 mile for Large Quantity Generators (LQG) and Small Quantity Generators (SQG) and 0.5 mile for Treatment, Storage, and Disposal (TSD) facilities.

• ERNS - Emergency Response Notification System. ERNS records and stores information on reported releases of oil and hazardous substances. The EPA and the NTIS are the sources of this database. This database was last issued on 31 December 2001, and the search distance was limited to the target property.

• BRS – Biennial Reporting System. The BRS is a national system administered by the EPA that collects data on the generation and management of hazardous waste. BRS captures data from LQG and TSD facilities. The EPA and the NTIS are the sources of this database. This database was last issued on 31 December 1999, and the search distance was not identified in the EDR report.

• CONSENT - Superfund (CERCLA) Consent Decrees. Major legal settlements that establish responsibility and standards for cleanup at Superfund sites. The EPA is the source of this database. The issue date for this database varies, and the search distance was 1.0 mile.

• ROD - Record of Decision. ROD documents mandate a permanent remedy at an NPL site containing technical and health information to aid in the cleanup. The NTIS is the source of this database. This database was last issued on 21 December 2001, and the search distance was 1.0 mile.

• Delisted NPL - NPL deletions. The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate. The EPA supplies this data. This database was last issued on 18 October 2002, and the search distance was 1.0 mile.

• FINDS - Facility Index System/Facility Identification Initiative Program Summary Report. FINDS contains both facility information and “pointers” to other sources that contain more detail. EDR includes the following FINDS databases in this report: PCS (Permit Compliance System), AIRS (Aerometric Information Retrieval System), DOCKET (Enforcement Docket used to manage and track information on civil judicial enforcement cases for all environmental statutes), FURS (Federal Underground Injection Control), CDOCKET (Criminal Docket System used to track criminal enforcement actions for all environmental statutes), FFIS (Federal Facilities Information System), STATE (State Environmental Laws and Statutes), and PADS (Polychlorinated Biphenyls (PCB) Activity Database System). This database was last issued on 10 October 2002, and the search distance was limited to the target property.
• HMIRS - Hazardous Materials Information Reporting System. HMIRS contains hazardous material spill incidents reported to the Department of Transportation (DOT). This database was last issued on 31 July 2002, and the search distance was limited to the target property.

• MLTS - Material Licensing Tracking System. MLTS is maintained by the Nuclear Regulatory Commission (NRC) and contains a list of approximately 8,100 sites which possess or use radioactive materials and are subject to NRC licensing requirements. This database was last issued on 21 October 2002, and the search distance was limited to the target property.

• MINES – Mines Master Index File. The source of the data is the Department of Labor, Mine Safety and Health Administration. This database was last issued on 10 September 2002, and the search distance was limited to 0.25 mile.

• NPL LIENS - Federal Superfund Liens. Under the authority granted the EPA by the CERCLA of 1980, the EPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner receives notification of potential liability. EPA compiles a listing of filed notices of Superfund liens. This database was last issued on 15 October 1991, and the search distance was limited to the target property.

• PADS - PCB Activity Database System. PADS identifies generators, transporters, commercial storers, and/or brokers and disposers of PCBs who are required to notify the EPA of such activities. This database was last issued on 20 September 2002, and the search distance was limited to the target property.

• RAATS - RCRA Administrative Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administrative actions after 30 September 1995, data entry in the RAATS database was discontinued due to a decrease in agency resources. The RAATS database is included in this search for historical reasons. This database was last issued on 17 April 1995, and the search distance was limited to the target property.

• TRIS - Toxic Chemical Release Inventory System. TRIS identifies facilities that release toxic chemicals to the air, water, and land in reportable quantities under SARA Title III Section 313. This database was last issued on 31 December 2000, and the search distance was limited to the target property.

• TSCA - Toxic Substances Control Act. TSCA identifies manufacturers and importers of chemical substances included on the TSCA Chemical Substance Inventory list. It includes data on the production volume of these substances by plant site. This database was last issued on 31 December 1998, and the search distance was limited to the target property.
• SSTS – Section 7 Tracking Systems. Section 7 of the Federal Insecticide, Fungicide and
Rodenticide Act as amended (92 Stat. 829). This information is provided by the EPA, and
includes types and amounts of pesticides, active ingredients and devices being produced, and
those having been produced and sold or distributed in the past year. This database was last
issued on 31 December 2000, and the search distance was limited to the target property.

• FTTS and FTTS INSP – FIFRA/TSCA Tracking System. Federal Insecticide, Fungicide,
& Rodenticide Act (FIFRA)/TSCA. This information is provided by the EPA, Office of
Prevention, Pesticides and Toxic Substances. This database was last issued on 24 October
2002, and the search distance was limited to the target property.

• SHWS – Inactive Hazardous Waste Disposal Sites in New York State. State hazardous
waste site records are the states’ equivalent to CERCLIS. These sites may or may not already
be listed on the federal CERCLIS list. The data come from the NYSDEC. This database
was last issued on 1 April 2002, and the search distance was 1 mile.

• SWF/LF - Solid Waste Facility Directory. SWF/LF type records typically contain an
inventory of solid waste disposal facilities or landfills in a particular state. The information
is provided by the NYSDEC. This database was last issued on 31 December 2001, and the
search distance was 0.5 mile.

• LTANKS – Spills Information Database. Leaking Underground Storage Tank Incident
Reports. The records contain an inventory of reported leaking underground storage tank
incidents reported from 1 April 1986 through the most recent update. This database was last
issued on 1 January 2002, and the search distance was 0.5 mile.

• UST - Registered Underground Storage Tanks. USTs are regulated under Subtitle I of
RCRA and must be registered with the state department responsible for administering the
UST program. The data is provided by the NYSDEC and identifies facilities that have
petroleum storage capacities in excess of 1,100 gallons and less than 400,000 gallons. This
database was last issued on 1 January 2002, and the search distance was 0.25 mile.

• CBS UST – Chemical Bulk Storage Database. The data are provided by the NYSDEC and
lists facilities that store regulated hazardous substances in underground tanks of any size.
This database was last issued on 1 January 2002, and the search distance was 0.25 mile.

• MOSF UST – Major Oil Storage Facilities Database. The data are provided by the NYSDEC
and lists facilities that may be onshore facilities or vessels, with petroleum storage capacities
of 400,000 gallons or greater. This database was last issued on 1 January 2002, and the
search distance was 0.5 mile.

• SWRCY – Registered Recycling Facility List. The data are provided by the NYSDEC and
lists recycling facilities. This database was last issued on 17 July 2000, and the search
distance was 0.5 mile.
• SWTIRE – Registered Waste Tire Storage & Facility List. The data are provided by the NYSDEC and lists registered waste tire storage facilities. This database was last issued on 1 September 2001, and the search distance was 0.5 mile.

• HSWDS – Hazardous Substance Waste Disposal Site Inventory. The data are provided by the NYSDEC and lists any known or suspected hazardous substance waste disposal sites. This database was last issued on 1 September 2002, and the search distance was 0.5 mile.

• AST – Listing of New York’s Registered Aboveground Storage Tanks. The source of this data is the NYSDEC. This database was last issued on 1 January 2002, and the search distance was limited to the target property.

• CBS AST – Chemical Bulk Storage Database. The data are provided by the NYSDEC and lists facilities that store regulated hazardous substances in ASTs with capacities of 185 gallons or greater and/or in USTs of any size. This database was last issued on 1 January 2002, and the search distance was 0.25 mile.

• MOSF AST – Major Oil Storage Facilities Database. The data are provided by the NYSDEC and lists facilities that may be onshore facilities or vessels, with petroleum storage capacities of 400,000 gallons or greater. This database was last issued on 1 January 2002, and the search distance was 0.5 mile.

• SPILLS – Spills Information Database. The data are provided by the NYSEDC and lists data collected on spills active as of April 1, 1986, as well as spills occurring since that date. This database was last issued on 1 January 2002, and the search distance was 0.125 mile.

• MANIFEST – Facility and Manifest Data. The data are provided by the NYSDEC. This database was last issued on 12 September 2002, and the search distance was not identified in the EDR report.

• Coal Gas - Former Manufactured Gas (Coal Gas) Sites. Data are provided from Real Property Scan, Inc., and the search distance was 1.0 mile.

• Brownfields – Brownfields Site List. The data is provided by the NYSDEC. This database was last issued on May 22, 2002 and the search distance was 0.5 mile.

• VCP – Voluntary Cleanup Agreements. The voluntary remedial program uses private monies to get contaminated sites remediated to levels allowing for the sites’ productive use. The program covers virtually any kind of site contamination. The data are provided by the NYSDEC. This database was last issued on 17 December 2002 and the search distance was 0.5 mile.
3.1.1 Subject Property

The subject property, 224 East Main Street, New Rochelle, New York, was listed by EDR on environmental databases as the New Rochelle DPW, Bldg. 3 ST & Hghwy Dept, Municipal Garage, New Rochelle City of City Yard, New Rochelle Municipal Yard, and New Rochelle Mun. Yard. In addition, two properties, the New Rochelle DPW, City Yard Garage and City Yard New Rochelle, 220 Main Street, were also listed on environmental databases as surrounding properties. These properties were identified as being less than 0.125 mile NW and NNE, respectively of the City Yard property. For the purpose of this report, it is assumed that the subject property also includes these two properties. The properties identified at 224 East Main Street were listed on the LTANKS, NY SPILLS, RCRIS-SQG, FINDS, UST, and AST databases.

According to EDR, the LTANKS database lists three spills for the 224 East Main Street site, two in 1998 and one in 1992. The 1998 spills include an unknown quantity of waste oil on 19 June and ten gallons of diesel on 19 February. The waste oil spill is identified as occurring due to tank failure, and a cleanup action was listed as not being determined. The cause of the diesel spill is listed as tank overfill and the spill is reported as being cleaned up with Speedi-Dri. Tank failure is also listed as the cause of the 1992 spill, which involved 50 gallons of gasoline. Approximately 5 yards of contaminated soil were removed and the ruptured underground storage tank line was repaired.

The NY SPILLS database lists a gasoline release at the site on 13 June 1991. The report indicated the spill possibly originated from the gas station across the street and that groundwater was affected. The incident was identified as an overfill spill that was cleaned up. A tank test confirmed that the tank was not leaking. The RCRIS-SQG database lists the subject property as a conditionally exempt small quantity generator and no violations were reported. FINDS identified Facility Registry System (FRS) and Resource Conservation and Recovery Act Information System (RCRINFO) as other pertinent environmental activity at the site. No additional information was provided.

The UST and AST databases identify 11 USTs and three ASTs at the site. Six USTs are listed as in-service for the storage of leaded gasoline (tanks MG002, MG003, MG004, and MG005) and Nos. 1, 2, or 4 fuel oil (tanks MG006 and SH001). The remaining five USTs (tank numbers MG001, MG007, MG008, MG009, and SD001) are identified as Closed–Removed. These former tanks were used to store used oil, unleaded gasoline, Nos. 1, 2 or 4 fuel oil, and diesel (two tanks). Installation dates for the USTs were not reported, but the USTs are listed as being constructed of steel/carbon steel. The three ASTs are identified as tanks MG10, MG11, and SD002 and are currently in-service storing diesel, unleaded gasoline, and Nos. 1, 2 or 4 fuel oil, respectively. The tanks were installed on 1 August 2001, tank MG10; 1 June 2001, tank MG11; and 1 April 1998, tank SD002, and are constructed of steel/carbon steel.

The two properties reported as the New Rochelle DPW, City Yard Garage and City Yard New Rochelle, 220 Main Street are listed on the LTANKS and NY SPILLS databases, respectively. The LTANKS database listed a tank test failure of a 2,000-gallon gasoline UST on 17 April 1998. A spill of unknown petroleum on 4 March 1998 was listed by NY SPILLS. Oil was reported coming out of an embankment and going into the Long Island Sound. The fire department responded to the spill and the NYSDEC handled the spill with the installation of a floatable debris collection system.
3.1.2 Surrounding Properties

Seventy-four properties were identified on government environmental databases by EDR within the search radius. These surrounding properties were listed on the CERCLIS-NFRAP, CORRACTS, RCRIS, SHWS, LTANKS, UST, NY VCP, CBS AST, SPILLS, Former Manufactured Gas (Coal Gas) Site, and Brownfields databases. Several of these properties occurred on more than one database. Also, properties were listed on additional databases not identified above, when located outside the database designated search radius. A summary of the environmental database information for the surrounding properties, as provided by EDR, is provided below.

CERCLIS-NFRAP - One site, Consolidated Edison on Echo Avenue, is listed on the CERCLIS-NFRAP database. The property is located between 0.125 and 0.25 mile to the southwest of the subject property at a higher elevation. The completed assessment history includes discovery on 19 April 1988, and archive site and preliminary assessment on 30 September 1992. It is assumed that as there is NFRAP for the Consolidated Edison site, it would pose a limited environmental threat to the subject property. However, due to the limited information provided by EDR for this database, an accurate determination regarding the Consolidated Edison property cannot be made.

CORRACTS - One site, Rush Manufacturing Corp at 10-12 Pine CT., is listed on the CORRACTS database. The property is located between 0.5 and 1.0 mile to the west-southwest of the subject property at a higher elevation. The EPA ID number for the site is identified as NYD075436394. The RCRIS Facility Assessment (RFA) for the property was completed as of 22 September 1992 and the facility was assigned a low corrective action priority as of 3 May 1994. Due to the distance from the site and the low corrective action priority, potential impacts to the subject property are not expected.

RCRIS - Seventeen sites are listed as small quantity generators within 0.25 mile of the subject property. Five of these sites are present between 0 and 0.125 mile of the City Yard property, and all seventeen sites are located at a higher elevation than the subject property. Based on EDR's report, one of the sites, Consolidated Edison on Echo Avenue, generated 22,260.00 pounds of D008 Waste (lead) in 1999. The EDR report states that no violations were reported for these facilities; therefore, these properties are expected to have minimal to no impact on the subject property.

SHWS – One site, Consolidated Edison on Echo Avenue, is listed on the SHWS database. As previously stated, the property is located between 0.125 and 0.25 mile to the southwest of the subject property at a higher elevation. PCBs were detected in soils and catch basin sediments and on surfaces within structures at the site. Subsequent sampling, following an initial clean-up, showed PCB levels as high as 50 parts per million (ppm) remaining. A preliminary site assessment (PSA) was conducted pursuant to a consent order. It was determined that concentrations of PCBs were still present in soils at levels above the cleanup goals. Additional soils were removed and additional sampling was conducted between 1995 and 1998. Site buildings and structures were removed in 1995. As of 1998, 600 tons of PCB contaminated soil were removed from on and off-site, including residential yards. In addition, backfilling with clean soil was conducted. One final area was to be excavated and backfilled with clean soil in 2002. An exposure assessment and fish and wildlife impact analysis for the off-site mudflat area are reported to be in progress. Due to the close proximity of the SHWS site and the nature and extent of the contamination, possible impacts to the subject property from this Consolidated Edison site may occur.
LTANKS – Thirty-four sites, between 0 and 0.5 mile of the site, are listed on the LTANKS database. Table 1 lists the site, the date the release occurred, the material released, the quantity released, the cause of release, and the date that the cleanup ceased.

</table>
All properties are located at a higher elevation than the subject property except for the Benjamin Residence. No further action (NFA) determinations were identified for 52 Sunhaven Dr, Toon Residence, Mutual Biscuit Company, Galesi Enterprises, 370 Main Street, 75 Rhodes Street, and 152 Sutton Manor Rd. Tanks and contaminated soil were removed from five of the NFA properties, a tank passed a re-test after refit at 370 Main Street property, and tanks were removed at the Mutual Biscuit Company.

Contaminated soil was encountered during tank removal at the Defender Marine Supply, New Rochelle Dodge, 17-19 Harding Dr., and 7-Up Bottling Co. properties, and contaminated soil and groundwater were encountered at the Mobile Oil S/S property. A tank was removed at Premium Cadillac Nissan, a line was leaking at a dispenser at Mario’s S/S, and holes were observed in a UST while it was being pulled at Plastic Works. LTANKS listings for Guglielmo Residence, Powertest, Echo & Main, Goncalves Residence, Cerratta, and New Rochelle Marina involve limited spills involving a sheen on dirty water at the end of the driveway, gasoline odors in basement, overfilling a tank, oil spraying from tank vent, and a leak from a gas pump, respectively. A groundwater investigation indicated that Sunoco/A-Plus was the source of groundwater contamination on 15 River Street and recovery wells were drilled at the Getty S/S property.

The NYSDEC has indicated that no further action (NFA) is necessary for seven of the sites listed in the LTANK’s database and cleanup ceased dates were provided for an additional 12 sites; therefore, little or no impact is expected to the City Yard property from these properties. Due to the lack of information, no determination can be made regarding potential impacts to the City Yard property for the remaining 15 properties.

UST – Fourteen UST sites are located within 0.25 mile of the subject property. Table 2 identifies the site, distance and direction from the site, quantity of tanks, tank contents and tank status.

</table>

Tank capacity data was not provided in the EDR report. As described in Section 3.1, the UST database provides information regarding the presence of registered underground storage tanks. Data regarding releases or leaks is not provided. Therefore, properties occurring on the UST database would not be considered an environmental threat to the subject property based solely on their presence on the UST database.

NY VCP and Brownfields - One site, Con Edison-Cedar St Works-New Rochelle MGP, is listed on the Voluntary Cleanup Agreements and Brownfields databases. Limited information provided in the EDR report includes the agreement type (VCP Agreement) and date signed (25 August 2002). Due to the lack of further information, no determination can be made concerning potential impacts to the subject property.

CBS AST - One site, the N R Wastewater Treatment Plant, is listed on this database. Information for four ASTs is provided; however, five total tanks with a total capacity of 9,000 gallons are
referred. The four tanks are used to store sodium hypochlorite. Two tanks each have a capacity of 1,900 gallons and 2,100 gallons (8,000 gallons total). As with the UST database, the CBS AST database identifies the presence of a tank, not the occurrence of any release. Therefore, the N R Wastewater Treatment Plant does not pose any environmental threat to the subject property based on its CBS AST listing.

SPILLS – Seven sites are listed on the NY Spills database. The sites are located between 0 and 0.125 mile from the subject property and are identified as Mc Donald’s, Main Street, UNK., Echo Bay, Tri-Star Nissan, US 1 Auto, and 40 Huntington Place. The spill at Mc Donald’s occurred on June 30, 2000 and involved children playing with mercury. A cleanup of a minor amount of mercury was performed by Tri-State cleanup. Three spills occurred at 206 Main Street under the names Main Street, UNK. and Echo Bay on 19 June 1987, 20 August 1987 and 14 February 1996, respectively. The spilled material was listed as unknown petroleum for the 1987 spills and NFA was determined necessary for the spills. The 1996 spill involved #2 fuel oil. The quantity of material released at the 206 Main Street sites was not provided. Two hundred gallons of unknown petroleum were spilled when two storage tanks tipped over at the Tri-Star Nissan site on 1 November 1989. “Hitchcock” Environmental is listed as the clean up consultant. An unknown quantity of waste oil was discharged into a floor drain at the US 1 Auto property on 22 June 1996. The spill class for the 40 Huntington Place spill is listed as “No spill occurred. No NYSDEC response. No corrective action required.” Based on the information provided by EDR, little to no environmental impacts to the subject property from the Mc Donald’s and 40 Huntington Place spills are anticipated. No determination regarding potential environmental impacts from the remaining spills can be made due to the limited information provided in the SPILLS database.

Although outside of the search radius for the SPILLS database (0.125 mile), the SPILL database identifies a petroleum release at the Consolidated Edison facility of 3,400 gallons on 1 January 1998. The release occurred as a result of an oil/water separator malfunction. Most of the spill (3,300 gallons) was contained in a diked area. The remaining 100 gallons overflowed. According to the EDR report, Consolidated Edison cleaned up the spill and the water contained less than 1 part per million (ppm) PCB.

Former Manufactured Gas (Coal Gas) Site - The New Rochelle Gas Co., 53 Cedar, New Rochelle, NY is listed as a Coal Gas Site. The site is located between 0.25 and 0.5 mile west of the subject property at a higher elevation. The former coal gas facility is described as being located on the southeast corner of Spring Street and Cedar (formerly Center) and being subsequently called American Gas Lite Co. and New York Suburban Gas Co. Due to its distance from the subject property, environmental impacts from the Coal Gas Site are not anticipated.
3.1.3 Orphan Sites

Thirty-eight orphan (unmappable due to inadequate address information) sites are denoted in the EDR report. Thirty-two of the sites are listed on the NY SPILLS database, three are listed on the UST database, two are listed on the RCRIS-SQG and FINDS databases, and one is listed on the LTANKS database. Table 3 lists the site name, address and database in which it occurred.

</tbody>
</table>

All sites are located in New Rochelle. For reasons previously stipulated, the three sites identified on the UST database would not pose an environmental concern to the subject property. The limited information provided for the remaining orphan sites curtails the possibility of determining if they would be of environmental concern to the subject property.
3.1.4 Wells

Three well databases (Federal USGS, Federal FRDS Public Water Supply (PWS), and State Database) were searched by EDR for the occurrence of potable water wells within a one-mile radius of the Site. Table 4 provides the database the well was listed by, the well ID number, its distance and direction from the subject property, the well depth, and the depth to water table.

Table 4 - Summary of Well Data

</tbody>
</table>

The primary uses of water for the Federal USGS wells are identified as commercial (three wells) and industrial (two wells). The remaining USGS well is listed as unused. According to the EDR report, the PWS well currently has or had major violation(s) or enforcement actions. Information regarding the direction of groundwater flow was not provided by EDR. Based on the information provided by the EDR report that the above listed wells are higher in elevation than the subject property, these wells are not likely to be impacted by the property.

3.2 Phase I Environmental Site Assessment, Hill International, Inc.

A Phase I ESA was performed on the 6.47-acre for the City of New Rochelle by HILL on 14 November 1994. A copy of this Phase I ESA is included in Appendix B. According to HILL, the facility has been used as a DPW staging area since at least 1917. A sewage disposal plant was also present on the subject property. The former plant and associated sewer right-of-way date back to at least 1911. A boathouse and an icehouse were identified on the site in 1911 and 1867, respectively. Six buildings were present on the site during the HILL’s assessment. The buildings were identified as a Carpentry Shop; a Sewers & Drains, Streets and Highways Building; a Compost Building; a Machinery/Car Storage Building; a Repair Garage; and Bookmobile Storage Building. Current uses of the facility during the 1994 assessment include parking, maintenance, washing, fueling and repair of City vehicles (except Fire Department vehicles), and as offices and staging area for DPW activities, including storage of road salt and sand and transfer station for recyclables.
HILL identified the following environmental concerns associated with activities at the City Yard property:

- Numerous activities on the site, principally associated with vehicle cleaning and repair but also including insecticide, weed killer, paint and paint solvent use, involve the use of hazardous materials and the generation of hazardous waste.

- The appearance of the soils in topographic lows, especially where pavement is absent, and the historic use of the site for the storage and maintenance of vehicles suggest the possibility of a buildup of petroleum hydrocarbons and other contaminants in soils in localized areas.

- As many as 14 tanks (two of which are not underground) may be present at the facility. Tank tightness tests were recommended to ascertain the ASTs integrity.

- File reviews from the Westchester DOH and the NYSDEC, Region 3 were still pending at the completion of the assessment and therefore, were not provided.

3.3 Report of Groundwater and Soil Investigation for Petroleum Contamination, HydroEnvironmental Solutions, Inc.

HydroEnvironmental Solutions, Inc. (HES) performed a subsurface investigation at the City Garage facility for the City of New Rochelle in August 2002. A copy of this subsurface investigation is included in Appendix C. The investigation was conducted in response to NYSDEC Spill Number 98-03810 and included drilling seven on-site test borings, installation of monitoring wells at the test boring locations, collection of soil and groundwater samples for laboratory analysis, and permeability testing at each monitoring well. The purpose of the investigation was to delineate the extent of petroleum hydrocarbon impacted soil and groundwater related to the operation of a municipal garage and refueling facility at the subject property.

Test borings were advanced to depths of 10.3 to 20 feet below grade (ftbg). All test borings encountered fill comprised mainly of gravel in a sandy, silty matrix. Groundwater was encountered at 7 to 10 ftbg in the test borings. Monitoring wells were installed to completion depths ranging from 10 to 20 ftbg. Based on HES's investigation, the bedrock at the subject property is mantled by 10 to 20 feet of unconsolidated glacial till.

HES concluded that dissolved and adsorbed benzene, toluene, ethylbenzene and total xylenes (BTEX) compounds, the most frequently encountered aromatic hydrocarbon compounds in gasoline, were present in the soils and groundwater beneath the site. Free-phase liquid hydrocarbon was documented in one of the six monitoring wells. Volatile organic compound (VOC) vapor screening results of drill cuttings and soil samples, and analytical results of soil and groundwater samples, indicate the majority of hydrocarbon impact is restricted to the westerly portion of the site. In addition, a buried seawall may be impeding downgradient hydrocarbon transport. HES determined that the hydraulic conductivity beneath the site was moderate to low, and speculated that this would also restrict downgradient transportation of dissolved petroleum hydrocarbons.

Based on the range of hydraulic conductivities beneath the site, HES believed that remedial alternatives for the site cleanup include soil vapor extraction (SVE), dual-phase high vacuum
extraction (DPHVE), and/or air sparging (AS). A pilot study was suggested in order to determine which remedial alternative would be the most suitable. Recommendations included:

- Perform quarterly groundwater monitoring and sampling program to document fluctuations in dissolved VOCs over time and free product accumulation in monitoring well MW-2.

- Conduct weekly free-phase product collection from monitoring well MW-2, with the collection to be reduced to semi-monthly or monthly if appropriate.

- Determine the impact of the documented spill on the bedrock aquifer, if any.

- Complete a multiple-technology pilot study to determine which remedial technology would prove the most appropriate for remediation of the documented gasoline spill.

3.4 **Scope of Work for Consulting Services for Site Remediation of Contamination at City Yard, Schoor DePalma, Inc.**

Schoor DePalma, Inc. submitted a Scope of Work (SOW) for Consulting Services for Remediation of Contamination at the City Yard property to the City of New Rochelle on 13 January 2003. A copy of the SOW is provided in Appendix D. The background section of the SOW identifies the following:

- The main source of petroleum hydrocarbon contamination at the City Yard facility is three former USTs that contained gasoline, diesel fuel, and waste oil.

- These tanks were removed in 1998, 2001, and 2002.

- The sump from a former sewer pump station still exists at the site approximately 30 ft bg.
  - Hydrocarbon product and petroleum-contaminated water were removed from the sewer pump station in 2001.

- The potential exists that the sewer pump station could be an ongoing source of groundwater contamination.

The Phase I aspects of the SOW include making a Final Determination of the Plume, conduct a Pilot Study and Design the Remediation System. Phase II components of the SOW are listed as the Construction/Installation of the Remediation System, providing Construction Inspection Services, and Report on the Effectiveness of the System.
3.5 Freedom of Information Act (FOIA) Requests

Foster Wheeler Environmental submitted FOIA requests to the EPA, NYSDEC, Westchester County Clerk, and Westchester County Health Department requesting information on all files regarding the City Yard property on 24 February 2003. Based on a telephone conversation with Ms. Melissa Nacerino, Director of Public Affairs, on 26 February 2003, the Westchester County Clerk's Office does not maintain records of environmental issues.

Ms. Toni Norfleet, NYSDEC FOIA Coordinator contacted Foster Wheeler Environmental on 28 February 2003 regarding additional location information for the City Yard site.

Seven spill summary sheets for the City Yard property were provided by the NYSDEC on 5 March 2003, in response to the FOIA request. The spill number, spill date, and description are provided in Table 5.

The response letter from the NYSDEC indicated the FOIA request had been forwarded to the Spill Prevention and Response Program(s) and that the Spills Program should be contacted directly to access their records. A response letter, dated 6 March 2003, was also received from the NYSDEC Office of Media relations indicating the FOIA request was forwarded to Records Custodians/Freedom of Information Law Coordinator(s). A response date of 20 March 2003 was indicated. Additional contacts regarding NYSDEC spills records will be performed as part of the continuing investigation process.

Acknowledgment letters were received from the Westchester County Health Department and EPA (both dated 27 February 2003). Anticipated responses to the FOIA requests were estimated at within twenty days for the EPA and by 20 March 2003 for the Westchester County Health Department. Copies of FOIA correspondence are provided in Appendix E. At the time this document was prepared EPA and Westchester County Health Department responses to the FOIA requests were not received by Foster Wheeler Environmental. FOIA letters from regulatory agencies received after submittal of this draft report will be forwarded to the EPA as addenda.
3.6 Physical Setting Sources

3.6.1 USGS Topographic Map

The US Department of the Interior, Geological Survey (USGS) Topographic Map Quadrangle (7.5-minute series) for Mount Vernon, N.Y. (dated 1966, photorevised 1979) was obtained to provide information on the subject property. The topography of the site slopes gently to the southeast with elevations ranging from 0 to 30 feet above Mean Sea Level (MSL). Site structural features are not identified on the map. The subject property and the surrounding area are shown in Figure 1.

3.6.2 Federal Emergency Management Agency Flood Insurance Rate Map

The FEMA FIRM for the City of New Rochelle, New York was reviewed to determine if the City Yard site occurs within a flood hazard area. According to panels 6 and 7 (community-panel numbers 360922 0006 C and 360922 0007 C, respectively), portions of the site occur within the 500 and 100-year floodplain. Approximately 25 percent of the site occurs within Zone A8, the 100-year floodplain. This area lies contiguous to Echo Bay and extends 50 to 100 feet into the site, with the wider area occurring in the northeast. Areas of the site that lie within Zone C (areas of minimal flooding) include the northwestern end of the site along Main Street (approximately 100 feet wide) and an area about 100 square feet in size in the southern portion of the property near Echo Bay. Areas of minimal flooding comprise approximately 25 percent of the site. The remaining 50 percent of the subject property occurs within Zone B, the 500-year floodplain.

3.6.3 Putnam and Westchester Counties Soil Survey

According to the Soil Survey of Putnam and Westchester Counties, New York (1994), the site soils are identified as Uf (Urban land). Urban lands are described as areas where at least 60 percent of the land surface is covered with buildings or other structures.

3.6.4 Westchester County GIS Database

National Wetland Inventory (NWI) wetland, NYSDEC wetland, Tidal wetland, hydric soil wetland and critical environmental area data were downloaded from the Westchester County GIS database. According to this database, there are no mapped wetlands within the boundaries of the subject property. Estuarine Non-vegetated (E1UBL) wetlands are identified by NWI as occurring along the eastern and southern edges of the subject property. NYSDEC wetlands are not present on or within the vicinity of the subject property. Coastal Shoals/Bars/Mudflats (SM) tidal wetlands are present in Echo Bay. Westchester County listed hydric soil wetlands are not located on the subject property. Udorthents, wet substratum (Uc) hydric soils are present on the northern and southern edges of the channel leading into Echo Bay from Long Island Sound. These hydric soils are defined as somewhat poorly drained to very poorly drained soils that have been altered mainly by filling. Based on this database, the City Yard property is located within the County Designated Long Island Sound Critical Environmental Area.
3.7 Historical Use Information Sources

3.7.1 Aerial Photographs

Historical aerial photographs for the years 1951, 1959, 1962, 1965, 1969, 1980, 1992, 1993, 1996, and 1999 were reviewed in order to obtain a representative understanding of the Site's developments. Coverage of the Site prior to 1951 was not available.

1951 – The City Yard site boundaries appear defined in the 1951 aerial photograph. Four buildings are located in the northern and central portions of the site. One building is segmented and L-shaped. It extends from the northern corner of the site, southwest along Main Street for about half of the property's width, and then southeast through the center of the property for about half the property's length. The flat roof structure of the southern portion of the segmented building differs from the angled structure of the remaining portion of the building, possibly indicating different construction dates. A large flat-roofed rectangular building is located in the center of the southwestern half of the property and two smaller detached buildings.

The main entrance to the facility appears to be between the segmented building in the northern corner of the site. Walls border the site's eastern boundary along Echo Bay and the southwestern boundary between the subject property and the Armory. Three rectangular structures are located at the southern tip of the site adjacent to Echo Bay. Vegetated areas are present on the site to the north and south of the large rectangular building. The wall separating the site from the Armory, and the site buildings enclose the northwestern corner of the property. Several anomalies are present within the enclosed area indicating it may have been used for material storage. The northwestern half of the site is being used for automobile parking. Access roads are present from the southern portion of the site to the southern end of the rectangular building and from the northern corner of the rectangular building into the enclosed storage area.

A large rectangular building is present in the northern portion of the property located to the northeast of the City Yard. A small parking area is located to the south of the building. An inlet or outfall is present to the east and south of the building. Development of the Armory property to the southwest of the City Yard is concentrated in the northwest portion of the parcel. Site improvements include three buildings and associated driveways and footpaths. An oval shaped, light colored anomaly is present in the southern portion of the site near the City Yard boundary. A walkway is also apparent from the buildings to a pier on the bay.

Vacant land is present to the east of the site, across Echo Bay, where the water treatment plant is currently located. The Consolidated Edison substation is present in its former location on the east side of Echo Avenue. Eleven ASTs are present on the property to the north of the Consolidated Edison substation, less than 0.5 mile to the southeast of the site, on the lot currently occupied by the garden center property.

1959 – Two of the three rectangular structures located at the southern tip of the property, as identified on the 1951 aerial photograph, are absent in 1959. Two additional buildings are present on the site in the northeastern half of the property. One building is located in the center of the parking area, and the other building is located along the northeastern site boundary. Anomalies are
present along the northeastern edge of the property along Echo Bay, and anomalies and automobiles are present in the enclosed northwestern portion of the site, indicating their possible use for material storage. Additional structures observed in the 1951 aerial photograph remain relatively unchanged in the 1959 aerial.

The wastewater treatment plant is present on the 1959 aerial photograph, east of the site across Echo Bay. The property lines of the wastewater treatment plant along Echo Bay are very straight and may indicate the construction of a pier, bulkhead or wall. The landmass of the property to the northeast of City Yard has extended to the south. The oval shaped anomaly located along the eastern border of the Armory property, identified on the 1951 aerial photograph is absent in 1959. However, two additional structures are located in the southern portion of the site. One along the eastern boundary of the site and another adjacent the dock along to the bay.

1962 – The remaining rectangular structure located at the southern tip of the property is absent in the 1962 aerial photograph. Anomalies are present in the northwestern corner and along the northeastern edge of the property indicating possible material storage. Possible ground scarring is visible in the vegetated area to the south of the rectangular building. No apparent changes to the remaining site structures from 1959 are present in the 1962 aerial photograph. The adjacent properties located to the northeast and southwest (Armory site) of the City yard exhibited no significant changes from the 1959 aerial photograph.

1965 – No apparent changes from 1962 are present on the 1965 aerial photograph. The boundaries of the water inlet located on the property to the northeast of the City Yard are more defined suggesting the presence of a wall, bulkhead or pier. The remaining areas, as well as the Armory to the southwest observed no changes from the 1962 photograph. A marina connected by a series of piers is apparent in the southwestern portion of Echo Bay. Several boats are docked in the marina.

1969 – A portion of the segmented building in the northern corner has been reduced in size and now appears to be the main entrance to the site. An additional flat roofed rectangular building, equal in size to the aforementioned rectangular building, is present in the southern portion of the site. The site has expanded into Echo Bay to the south and northeast. Automobiles are parked in the northeastern corner of the site. Anomalies are present in the northeast half of the site, indicating possible material storage.

The Armory property to the southwest of the City Yard has expanded into Echo Bay. A parking lot has also been constructed to the south of the cluster of buildings located in the northern portion of the property. The remaining structures and access roads of the property remain the same. Docked boats surround the marina. The outline of the bay is similar to that observed in the 1965 photograph, but more defined. Trees surround the inclusion to the west of the bay. The remaining structures surrounding the City Yard property are intact.

1980 – The site has extended into Echo Bay to the northeast, east, and south. Anomalies are present in the northwest corner of the site, southern tip, and eastern portion of the site, indicating possible material storage. The small building that was previously located in the center of the parking area in the northeastern half of the property is absent.
No significant changes to the property to the northeast of the City Yard are apparent. The Armory property has extended into the bay. Boats are not present in Echo Bay near the marina probably due to the time of year (March) the photograph was taken. Four large cylindrical structures and a rectangular structure have been added to the lower portion of the wastewater treatment plant facility.

1992 – Anomalies are present in the northwestern corner and along the eastern edge of the site along Echo Bay indicating material storage. Automobiles are parked primarily in the northeastern half of the property. The ASTs that were formerly observed on the garden center property have been removed; however, the surrounding structures still remain.

No significant changes to the property located to the northeast of the City Yard or the Armory are apparent. Boats are docked by the marina.

1993 – Anomalies are present in the northwestern corner of the property and along the northeast, eastern, and southern edges of the property, indicating possible material storage. Automobiles and trucks are present in the northeastern half of the property. No significant alterations to the remaining site features from those observed on the 1992 aerial photograph are present in the 1993 aerial.

Structures on the property to the northeast of the City Yard remain unchanged. On the Apart from the absence of the walkway from the main buildings to the dock, on the Armory property, the area remains the same as that observed in the 1992 aerial photograph. Farther west, no apparent changes on marina from 1992 are present on the 1993 aerial photograph.

1996 – Three three-sided concrete storage structures are apparent along the northeastern edge of the site. Anomalies are present in the northwestern corner, and southeastern and southern edge of the site indicating possible material storage. Automobiles and trucks are concentrated in the northeastern half of the site. No apparent changes to site structures since 1993 were observed on the 1996 aerial photograph.

The property to the northeast of the City Yard remains relatively unchanged from that observed on the 1996 aerial photograph. The access road connecting the Armory’s main buildings to the former dock area (not observed in the 1993 aerial photograph) is present. In addition, the southern border of the Armory, along the coastline, appears to have been filled. Farther west fewer boats appear to be present in the marina. Most of the boats observed are located on the eastern portion of the site. All structures on the Consolidated Edison property have been removed.

1999 – Site features remain relatively unchanged from the 1996 aerial photograph on the aerial photograph from 1999. Structurally, the property to the northeast of the City Yard property and the Armory remains the same since the 1996 aerial photograph. All boats have been removed off the marina boundaries. The dock noted in the 1996 photograph has been removed as well. The surrounding areas remained the same as that observed in the 1996 aerial photograph.
3.7.2 Sanborn Fire Insurance Maps

EDR Sanborn fire insurance maps for the years 1911, 1931, 1942, 1951, and subsequent years from 1990 to 1996 were reviewed to ascertain the historical uses of the City Yard property. Copies of the maps are provided in Appendix F.

The 1911 Sanborn map illustrates a border along Echo Bay that is not as filled in as the current boundary. The total area of the site property is smaller in 1911 due to the increase in borders found in current observations. Four structures are found on the site, two unnamed, one labeled Boat Shop and the other “portal.” An underground structure is also located less than 50 feet south of the Boat Shop. The northeastern edge of the site is labeled Stonbergs Boat Yard. An unoccupied structure is located on the property north of the City Yard property.

The 1931 Sanborn map illustrates the ownership of the property to the Department of Public Works – Bureau of Streets. The original two structures along the shore of Echo Bay (Boat Shop and underground structure) have been removed from the property. Several buildings have been erected on site and labeled Sewage Disposal Plant, Compost Building, Street Cleaning Machine, Auto Trucks, Tools, Storage, Office and three unnamed, connected structures. The unoccupied structure, identified on the property to the north of the City Yard on the 1911 Sanborn, is labeled as Auto sales and service, and a houseboat is located on the mouth of Echo Bay from Main Street. A small cluster of structures (3) were located on the property southwest of the City Yard property.

The 1942 Sanborn map indicates no additional structures on the property. An unnamed unpaved road leading to the Armory is indicated on the 1942 map. On the adjacent property (the Naval Militia Armory), several structures labeled Drill Shed have been erected.

The 1951 Sanborn map indicates the presence of a municipal garage west of the Sewage Disposal Plant. The original small, unnamed structures are no longer present on the site or in the adjacent Armory Site.

The 1990 and subsequent 1991 to 1996 Sanborn maps only reveal the northern portion of the site. Changes on the site include an unnamed structure to the south of the municipal garage, and the removal of the Sewage Disposal Plant. The open area between the buildings of the Department of Public Works and Echo Bay are indicated as vehicle storage and parking area. Another unnamed structure was built on the eastern side of the site along Echo Bay. The mouth of Echo Bay that connects to Main Street is filled in and no longer a body of water associated with Echo Bay. The structures and their uses surrounding the site property remained the same. The houseboat on Echo Bay located on the site to the east of the site property is no longer present. Subsequent maps for 1991 to 1996 reveal no change to the City Yard property since the 1990 Sanborn map.

3.7.3 City of New Rochelle Department of Public Works Maps

Copies of two DPW maps of the City Yard property were provided to Foster Wheeler Environmental by the City of New Rochelle. The Groundwater Monitoring System at City Garage Map is provided in Attachment G and the Topo and Site Elevations Map of the City Yard property is provided as Figure 2, Site Layout Plan.
Groundwater Monitoring System at City Garage Map – The map is dated 6 March 2002 and identifies the locations of the six site monitoring wells, the three removed USTs, one current UST, two new ASTs, and the location of the Abandoned Sewer Pump Station where product was removed. The map indicates that the pump station is partially backfilled. Based on the map, one monitoring well is located between the Automotive Repair Garage and the Vehicle Storage Garage, and the remaining five wells are located to the east of the Automotive Repair Garage.

The two former USTs, contents not identified, were located between the two aforementioned buildings and one former waste oil UST was located south of the Automotive Repair Garage. All three removed USTs were located towards the eastern end of the garage and the remaining UST. The abandoned sewer pump station is located near the northeast corner of the Automotive Repair Garage and the two new ASTs are located to the northeast of the Automotive Repair Garage. The remaining UST is located between the two structures.

Topo and Site Elevations map of the City Yard – The map is dated 14 December 1972 and identifies the structures at the City Yard property. Six buildings are identified as well as the sewer easements. Four USTs are identified between the Vehicle Storage Garage and the Automotive Repair Garage, two 5,000-gallon tanks (one heating oil and one diesel) and two 2,000-gallon tanks (one regular gas and one high test). A kerosene storage tank on concrete blocks is present to the west of the salt and sand storage area. A “new” transformer is denoted near the northwest corner of the Automotive Repair Garage. The waste oil UST located to the south of the Automotive Repair Garage on the Groundwater Monitoring System at City Garage Map was not identified on the topo and site elevation map of the City Yard.
On Wednesday, 5 March 2003, Dr. Robert Chozick and Mr. Richard Delahunty of Foster Wheeler Environmental met with Messrs. Craig King, Commissioner, Department of Development; Lewis Wendell, Deputy Commissioner, Department of Development; John Clemente, Deputy Commissioner and City Engineer, Department of Public Works; and, Kaz Orszulik, Senior Engineer, Department of Public Works, all with the City of New Rochelle, New York. Mr. Wendell provided Foster Wheeler Environmental with a copy of the Phase I ESA that was performed on the City Yard by HILL in 1994 (discussed in Section 3.2 and provided as Appendix B). Mr. Orszulik provided copies of the Subsurface Investigation at the City Garage prepared by HES in 2002 (discussed in Section 3.3 and provided as Appendix C), the SOW for Consulting Services for Remediation of Contamination at the City Yard submitted by Schoor Depalma, Inc. in 2003 (discussed in Section 3.3 and provided as Appendix D), a Topo and Site Elevations map of the City Yard and a Groundwater Monitoring System at City Garage map (discussed in Section 3.7.3). The Topo and Site Elevations map of the City Yard property is included as Figure 2, Site Layout Plan and the Groundwater Monitoring System at City Garage Map is provided in Attachment G.

According to Mr. Orszulik, three USTs have been removed from the property; however, to date they do not have any closure documentation from the State. He added that 14,000 gallons of free product have been pumped out of the basement of the old treatment plant. Mr. Orzulik stated that Schoor Depalma, Inc. would be commencing with work in the southern half of the site. He emphasized that EPA would be investigating the northern portion of the site.
5.0 CONCLUSIONS AND RECOMMENDATIONS

Foster Wheeler Environmental has performed this background investigation of the City Yard property on behalf of the EPA. The City Yard property is currently owned by the City of New Rochelle and occupied by the City’s Department of Public Works. The property is located at 224 East Main Street, New Rochelle, New York and is identified as Block 84, Lot 5. The property is an irregular shaped 6.47-acre parcel of land and is bound by Main Street to the north, a commercial property and Echo Bay to the east, Echo Bay to the south, and the City Armory property to the west. The majority of the property is developed and occupied by six buildings, storage structures and material storage, and parking and driveway areas. These buildings are used as a Carpentry Shop; Sewers & Drains, Streets and Highways, and Sanitation Building; Compost Building; Machinery/Car Storage; Repair Garage; and Bookmobile Storage Building. The area is currently zoned M-1 and M-3, which is identified as light and heavy manufacturing, respectively. Mixed commercial properties including restaurants, delicatessens, car dealers, and small retail shops line Main Street in the vicinity of the site. Residential properties dominate the secondary streets.

The City Yard property is contiguous to Echo Bay of the Long Island Sound and is located within the Westchester County Designated Long Island Sound Critical Area. The topography of the property slopes gently to the southeast with elevations ranging from 0 to 30 feet above MSL. The portion of the property contiguous to Echo Bay, approximately 25 percent of the property, occurs within the 100-year floodplain. Areas of minimal flooding comprise approximately 25 percent of the property. The remaining 50 percent of the subject property occurs within the 500-year floodplain. The site soils are identified as Urban land where at least 60 percent of the land surface is covered with buildings or other structures. E1UBL wetlands are identified by NWI as occurring along the eastern and southern edges of the subject property.

Three well databases (Federal USGS, Federal FRDS PWS, and State Database) were searched by EDR for the occurrence of potable water wells within a one-mile radius of the property. Six Federal USGS wells and one Federal FRDS PWS well are located within one mile of the City Yard property. One of the Federal USGS wells was identified as unused. The primary uses of water for the remaining wells include commercial (three wells) and industrial (two wells). The PWS well currently has or had major violation(s) or enforcement actions. Information regarding the direction of groundwater flow was not provided by EDR.

Foster Wheeler Environmental’s investigation identified the following areas of concern and associated recommendations.

- **Groundwater and Soil Investigation** – A 2,000-gallon gasoline UST failed at the facility. Approximately 1,400 gallons of free product were pumped out of the basement of the former treatment plant. A groundwater and soil investigation performed by HES concluded that dissolved and adsorbed BTEX compounds were present in the soils and groundwater beneath the City Yard property. Free-phase liquid hydrocarbon was documented in one of the six monitoring wells. VOC vapor screening results of drill cuttings and soil samples and analytical results of soil and groundwater samples indicate the majority of hydrocarbon impact is restricted to the westerly portion of the City Yard property. Schoor DePalma, Inc. has been contracted by the City of New Rochelle to make a final determination of the extent of the plume, conduct a pilot study and design the remediation system, construct and install
the remediation system, provide construction inspection services, and report on the effectiveness of the system.

- **Consolidated Edison property** – A former Consolidated Edison substation was located on Echo Avenue between 0.125 and 0.25 mile to the southwest of the subject property at a higher elevation. According to EDR, the facility was listed on the CERCLIS-NFRAP, RCRIS, SHWS, FINDS, TRIS and NY SPILLS databases. Cleanup activities to remove PCB contaminated soil and sediment from the Consolidated Edison property, adjacent commercial and residential properties and the Echo Bay tidal lands are almost complete. The cleanup involved removing contaminated material and replacing with clean fill. Based on the EDR report, final remedial activities should be completed in 2002. It is not know if these activities were completed. The SPILL database identifies a petroleum release of 3,400 gallons on 1 January 1998. The release occurred as a result of an oil/water separator malfunction. Most of the spill (3,300 gallons) was contained in a diked area, and the remaining 100 gallons overflowed. According to the EDR report, Consolidated Edison cleaned up the spill and the water contained less than 1 ppm PCBs. It is recommended that soil and sediment samples be collected from the southern portion of the site along Echo Bay and analyzed for PCBs to evaluate potential impacts to the site from the former Consolidated Edison facility.

- **Spills** – Seven spills were identified by NYSDEC and/or EDR as occurring at the City Yard property. Two spill reports are identified regarding the tank test failure of a 2,000-gallon gasoline UST, one on 17 April 1998 and one on 1 May 2001. The latter report identified that HydroEnvironmental Solutions had investigated the spill and that six monitoring wells were installed. It was recommended that a pilot study be conducted to determine a suitable remedial technology. A tank failure was reported to the NYSDEC on 25 June 1998. The DEC sent a letter to DPW on 5 March 2002 stating that the tank and impacted soil must be removed within 60 days. An unknown quantity of waste oil was spilled due to tank failure on 19 June 1998. No cleanup action was determined. A #2 fuel oil tank test failure was reported to the NYSDEC on 6 March 1998.

A spill of unknown petroleum was reported coming out of an embankment and going into the Long Island Sound on 4 March 1998. The NYSDEC handled the spill with the installation of a floatable debris collection system. Ten gallons of diesel was spilled as a result of a tank overfill on 19 February 1998. The spill is reported as being cleaned up with Speedi-Dri. Tank failure is listed as the cause of a 50-gallon gasoline spill that occurred on 17 September 1992. Approximately 5 yards of contaminated soil were removed and the ruptured underground storage tank line was repaired. A gasoline release at the site on 13 June 1991 may have originated from the gas station across the street. The incident was identified as an overfill spill that was cleaned up. A tank test confirmed that the tank was not leaking. It is recommended that supplemental information regarding site spills be reviewed as part of the ongoing site investigation and that soil and groundwater sampling be performed in the vicinity of the identified spills to evaluate potential subsurface impacts.

- **USTs** – Based on HILL’s Phase I ESA, up to 12 USTs may be present at the site. EDR identified eleven USTs (six in-service and five closed-removed). The in-service tanks are identified as used for the storage of leaded gasoline (tanks MG002, MG003, MG004 and MG005) and Nos. 1, 2, or 4 fuel oil (tanks MG006 and SH001). The five closed tanks (tank
numbers MG001, MG007, MG008, MG009, and SD001) were used to store used oil, unleaded gasoline, Nos. 1, 2, or 4 fuel oil, and diesel (two tanks). According to Mr. Orszulik, and the Groundwater Monitoring System at City Garage map, three leaking USTs have been removed from, and one UST is still present in, the southern portion of the property near the Automotive Repair Garage. The removed leaking tanks were used to store waste oil, gasoline, and diesel and the in-use tank is used to store heating fuel oil. Mr. Orszulik stated that closure documentation for the removed tanks is pending from the NYSDEC. An additional gasoline UST is identified near the Automotive Repair Garage on the Topo and Site Elevations Map of the City Yard property. The tank is identified in the same location as the two former gasoline and diesel tanks mentioned above. It is recommended that the locations of all in-use and former USTs at the City Yard property be determined and obtain any UST closure reports and tank test reports be obtained. It is also recommended that soil and groundwater sampling be performed in the vicinity of the former USTs to evaluate potential subsurface impacts.

- **ASTs** – The EDR report lists three in-service ASTs (tanks MG10, MG11 and SD002) at the facility storing diesel, unleaded gasoline, and Nos. 1, 2, or 4 fuel oil, respectively. The tanks were installed in 1 August 2001, tank MG10; 1 June 2001, tank MG11; and 1 April 1998, tank SD002. According to Mr. Orszulik, and the Groundwater Monitoring System at City Garage Map, two new ASTs were installed to replace the two removed leaking USTs near the Automotive Repair Garage. These two new tanks are used to store diesel and gasoline. According to the Topo and Site Elevations Map of the City Yard property, a kerosene storage tank on concrete blocks is present in the central portion of the site. If stained areas are observed in the vicinity of the ASTs during the site inspection, then soil sampling should be performed in the stained areas to determine if any environmental impacts have resulted from the ASTs.

- **Site History** – Based on HILL’s Phase I ESA, the appearance of the soils in topographic lows, especially where pavement is absent, and the historic use of the site for the storage and maintenance of vehicles suggest the possibility of a buildup of petroleum hydrocarbons and other contaminants in soils in localized areas. If stained areas are observed during the site inspection, soil sampling should be performed in the stained areas to determine if any environmental impacts have resulted from the former site activities.

- **Transformer** – One transformer is identified on the Topo and Site Elevations Map of the City Yard property between the Automotive Repair Garage and the Vehicle Storage Garage. If stained areas are observed in the vicinity of the identified transformer or additional site transformers are observed during the site inspection, soil sampling should be performed in the stained areas to determine if any environmental impacts have resulted from the transformer(s).

- **Lead-based Paint and Asbestos Containing Building Material (ACBM)** – Due to the age of the buildings at the facility, the possibility of the presence of lead-based paint and ACBM in the structures exists. If suspect material is observed during the site inspection, sampling of the material should be performed to assess the possible presence of lead-based paint and/or asbestos.
• **Drains** – If it is determined that floor drains are present within the facility's structures, the discharge points should be determined and samples collected in the drain and at the discharge location, if possible.

• **Non-native Fill** – According to the 1969 and 1980 aerial photographs, the City Yard property was expanded into Echo Bay. The origin of this fill material is not known. Therefore, sampling of the material is recommended to determine if any environmental impacts have resulted from the introduction of this material to the site.

TC930617.1s Page 1
A search of available environmental records was conducted by Environmental Data Resources, Inc. (EDR). The report meets the government records search requirements of ASTM Standard Practice for Environmental Site Assessments, E 1527-00. Search distances are per ASTM standard or custom distances requested by the user.

**TARGET PROPERTY INFORMATION**

**ADDRESS**

224 MAIN STREET
NEW ROCHELLE, NY 10801

**COORDINATES**

Latitude (North): 40.914000 - 40' 54' 50.4"
Longitude (West): 73.771400 - 73' 46' 17.0"
Universal Tranverse Mercator: Zone 18
UTM X (Meters): 603465,2
UTM Y (Meters): 4529725,0

**USGS TOPOGRAPHIC MAP ASSOCIATED WITH TARGET PROPERTY**

Target Property: 2440073-H7 MOUNT VERNON, NY
Source: USGS 7.5 min quad index

**TARGET PROPERTY SEARCH RESULTS**

The target property was identified in the following government records. For more information on this property see page 6 of the attached EDR Radius Map report:

EXECUTIVE SUMMARY

DATABASES WITH NO MAPPED SITES
No mapped sites were found in EDR’s search of available ("reasonably ascertainable") government records either on the target property or within the ASTM E 1527-00 search radius around the target property for the following databases:

**FEDERAL ASTM STANDARD**
- NPL: National Priority List
- Proposed NPL: Proposed National Priority List Sites
- CERCLIS: Comprehensive Environmental Response, Compensation, and Liability Information System
- RCRIS-TSD: Resource Conservation and Recovery Information System
- RCRIS-LGG: Resource Conservation and Recovery Information System
- ERSN: Emergency Response Notification System

**STATE ASTM STANDARD**
- SWF/LF: Facility Register
- CBS UST: Chemical Bulk Storage Database
- MOSF UST: Major Oil Storage Facilities Database
- SWTIRE: Registered Waste Tire Storage & Facility List
- SWRCY: Registered Recycling Facility List

**FEDERAL ASTM SUPPLEMENTAL**
- CONSENT: Superfund (CERCLA) Consent Decrees
- ROD: Records Of Decision
- Delisted NPL: National Priority List Deletions
- HMIRS: Hazardous Materials Information Reporting System
- MLTS: Material Licensing Tracking System
- MINES: Mines Master Index File
- NPL Liens: Federal Superfund Liens
- PADS: PCB Activity Database System
- RAATS: RCRA Administrative Action Tracking System
- TRIS: Toxic Chemical Release Inventory System
- TSCA: Toxic Substances Control Act
- SSTS: Section 7 Tracking Systems
- FTTS: FIFRA/ TSCA Tracking System - FIFRA (Federal Insecticide, Fungicide, & Rodenticide Act)/TSCA (Toxic Substances Control Act)

**STATE OR LOCAL ASTM SUPPLEMENTAL**
- HSWDS: Hazardous Substance Waste Disposal Site Inventory
- MOSF AST: Major Oil Storage Facilities Database

**BROWNFIELDS DATABASES**
- Brownfields: Brownfields Site List

**SURROUNDING SITES: SEARCH RESULTS**
Surrounding sites were identified.
EXECUTIVE SUMMARY

Elevations have been determined from the USGS 1 degree Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. EDR's definition of a site with an elevation equal to the target property includes a tolerance of +/- 10 feet. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property (by more than 10 feet). Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in **bold italics** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

FEDERAL ASTM STANDARD

CERCLIS-NFRAP: As of February 1995. CERCLIS sites designated "No Further Remedial Action Planned" (NFRAP) have been removed from CERCLIS. NFRAP sites may be sites where, following an initial investigation, no contamination was found, contamination was removed quickly without the need for the site to be placed on the NPL, or the contamination was not serious enough to require Federal Superfund Action or NPL consideration. EPA has removed approximately 25,000 NFRAP sites to lift the unintended barriers to the redevelopment of these properties and has archived them as historical records so EPA does not needlessly repeat the investigations in the future. This policy change is part of the EPA's Brownfields Redevelopment Program to help cities, states, private investors and affected citizens to promote economic redevelopment of unproductive urban sites.

A review of the CERC-NFRAP list, as provided by EDR, and dated 12/13/2002 has revealed that there is 1 CERC-NFRAP site within approximately 0.25 miles of the target property.

CORRACTS: CORRACTS is a list of handlers with RCRA Corrective Action Activity. This report shows which nationally-defined corrective action core events have occurred for every handler that has had corrective action activity.

A review of the CORRACTS list, as provided by EDR, and dated 09/29/2002 has revealed that there is 1 CORRACTS site within approximately 1 mile of the target property.

RCRIS: The Resource Conservation and Recovery Act database includes selected information on sites that generate, store, treat, or dispose of hazardous waste as defined by the Act. The source of this database is the U.S. EPA.

A review of the RCRIS-SQG list, as provided by EDR, and dated 09/09/2002 has revealed that there are 17 RCRIS-SQG sites within approximately 0.25 miles of the target property.

### STATE ASTM STANDARD

**SHWS:** The State Hazardous Waste Sites records are the states' equivalent to CERCLIS. These sites may or may not already be listed on the federal CERCLIS list. Priority sites planned for cleanup using state funds (state equivalent of Superfund) are identified along with sites where cleanup will be paid for by potentially responsible parties. The data come from the Department of Environmental Conservation's Inactive Hazardous waste Disposal Sites in New York State.

A review of the SHWS list, as provided by EDR, has revealed that there is 1 SHWS site within approximately 1 mile of the target property.

<table>
<thead>
<tr>

<tbody>
<tr>
<td>CONSOLIDATED EDISON - ECHO AVE</td>
<td>ECHO AVENUE</td>
<td>1/8 - 1/4WSW</td>
<td>J48</td>
<td>48</td>
</tr>
</tbody>
</table>

**LTANKS:** Leaking Storage Tank Incident Reports. These records contain an inventory of reported leaking storage tank incidents reported from 4/1/86 through the most recent update. They can be either leaking underground storage tanks or leaking aboveground storage tanks. The causes of the incidents are tank test failures, tank failures or tank overfills.

A review of the LTANKS list, as provided by EDR, and dated 01/01/2002 has revealed that there are 35 LTANKS sites within approximately 0.5 miles of the target property.

EXECUTIVE SUMMARY

NY VCP: Voluntary Cleanup Agreements. The voluntary remedial program uses private monies to get contaminated sites remediated to levels allowing for the sites' productive use. The program covers virtually any kind of site and contamination.

A review of the VCP list, as provided by EDR, and dated 12/17/2002 has revealed that there is 1 VCP site within approximately 0.5 miles of the target property.

STATE OR LOCAL ASTM SUPPLEMENTAL

CBS AST: Chemical Bulk Storage Database. Registration data collected as required by 6 NYCRR Part 596. It includes facilities storing hazardous substances listed in 6 NYCRR Part 597, in aboveground tanks with capacities of 185 gallons or greater, and/or in underground tanks of any size. Includes facilities registered (and closed) since effective date of CBS regulations (July 15, 1988) through the date request is processed.

A review of the CBS AST list, as provided by EDR, and dated 01/01/2002 has revealed that there is 1 CBS AST site within approximately 0.25 miles of the target property.

SPILLS: Data collected on spills reported to NYSDEC. Is required by one or more of the following: Article 12 of the Navigation Law, 6 NYCRR Section 613.8 (from PBS regs), or 6 NYCRR Section 595.2 (from CBS regs). It includes spills active as of April 1, 1986, as well as spills occurring since this date.

A review of the NY Spills list, as provided by EDR, has revealed that there are 8 NY Spills sites within approximately 0.125 miles of the target property.

Hazardous Waste: PCBs (B007)
Site Description: The site, approximately 150 feet x 600 feet in size, was originally
CONSOLIDATED EDISON - ECHO AVE. SITE (Continued)

owned by Westchester Lighting Co. and subsequently was acquired by Consolidated Edison in the early 1930's. Con Ed operated an electrical distribution substation at this site until 1981, when the substation was closed. The site is bounded by a fuel oil dealer, a tidal creek, Echo Bay (Long Island Sound), and private residences. The site includes substation buildings and a transformer yard. PCBs have been found in soils and catch basin sediments, and on surfaces within structures. Con Ed has completed initial clean-up. Subsequent sampling showed PCB levels as high as 50 ppm remaining. A Preliminary Site Assessment (PSA) was conducted pursuant to a consent order. The results showed areas of site soils to be contaminated with PCBs above the cleanup goals of 1 ppm. These soils were removed from the site. Additional sampling of both on-site and off-site soils and sediments were conducted between 1995 & 1998. One sample showed high levels of PCBs in soils greater than 1900 ppm. Echo Bay sediments showed one area at 220 ppm. All site buildings and structures were removed in August of 1995. As of February 1998, 600 tons of PCB contaminated soil was removed from on and off site, including four residential yards. Removal of on-site concrete slabs and soil sampling of those soils under each slab has been completed and small quantities of PCB contaminated soils and sediments in unmapped buried trenches were removed. Backfilling with clean soil in parts of the site was completed. One final area of the site will be excavated and backfilled with clean soil in 2002. An exposure assessment and a fish and wildlife impact analysis for the off-site mudflat area are in progress.

On site soil and sediment contain PCBs. Echo Bay sediments contain significant levels of PCB. The back yards of private residences were found to be contaminated with PCBs at levels from 1.1 to 5.6 ppm.

The site is immediately adjacent to residential and commercial properties and extends to the Echo Bay tidal lands. Access to the site is restricted by chain link fencing. PCBs had been found at elevated levels in the former substation building and surrounding soil. Cleanup of PCBs is nearing completion and the majority of the site has been covered with clean fill. Final remedial activities should be completed in 2002. Soil sampling conducted at adjacent residential properties found PCBs in four yards above the cleanup guideline of 1 part per million. The PCB contaminated soils in the yards were excavated and removed. There are no known drinking water supply wells in the vicinity.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

**Elapsed ASTM days:** Provides confirmation that this EDR report meets or exceeds the 90-day updating requirement of the ASTM standard.

**FEDERAL ASTM STANDARD RECORDS**

**NPL:** National Priority List

- **Source:** EPA
- **Telephone:** N/A

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA’s Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

- **Date of Government Version:** 10/24/02

**CERCLIS:** Comprehensive Environmental Response, Compensation, and Liability Information System

- **Source:** EPA
- **Telephone:** 703-413-0223

CERCLIS contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). CERCLIS contains sites which are either proposed to or on the National Priorities List (NPL) and sites which are in the screening and assessment phase for possible inclusion on the NPL.

**CERCLIS-NFRAP:** CERCLIS No Further Remedial Action Planned

- **Source:** EPA
- **Telephone:** 703-413-0223

As of February 1995, CERCLIS sites designated “No Further Remedial Action Planned” (NFRAP) have been removed from CERCLIS. NFRAP sites may be sites where, following an initial investigation, no contamination was found, contamination was removed quickly without the need for the site to be placed on the NPL, or the contamination was not serious enough to require Federal Superfund action or NPL consideration. EPA has removed approximately 25,000 NFRAP sites to lift the unintended barriers to the redevelopment of those properties and has archived them as historical records so EPA does not endlessly repeat the investigations in the future. This policy change is part of the EPA’s Brownfields Redevelopment Program to help cities, states, private investors and affected citizens to promote economic redevelopment of unproductive urban sites.

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be
complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the
area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily
mean that wetlands do not exist in the area covered by the report.
Oil/Gas Pipelines/Electrical Transmission Lines: This data was obtained by EDR from the USGS in 1994. It is referred to by USGS as GeoData Digital Line Graphs from 1:100,000-Scale Maps. It was extracted from the transportation category including some oil, but primarily gas pipelines and electrical transmission lines.

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

Flood Zone Data: This data, available in select counties across the country, was obtained by EDR in 1999 from the Federal Emergency Management Agency (FEMA). Data depicts 100-year and 500-year flood zones as defined by FEMA.

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002 from the U.S. Fish and Wildlife Service.

UTM Y (Meters): 4529725.0

EDR's GeoCheck Physical Setting Source Addendum has been developed to assist the environmental professional with the collection of physical setting source information in accordance with ASTM 1527-00, Section 7.2.3. Section 7.2.3 requires that a current USGS 7.5 Minute Topographic Map (or equivalent, such as the USGS Digital Elevation Model) be reviewed. It also requires that one or more additional physical setting sources be sought when (1) conditions have been identified in which hazardous substances or petroleum products are likely to migrate to or from the property, and (2) more information than is provided in the current USGS 7.5 Minute Topographic Map (or equivalent) is generally obtained, pursuant to local good commercial or customary practice, to assess the impact of migration of recognized environmental conditions in connection with the property. Such additional physical setting sources generally include information about the topographic, hydrologic, hydrogeologic, and geologic characteristics of a site, and wells in the area.

Assessment of the impact of contaminant migration generally has two principle investigative components:

1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata. EDR's GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.
GROUNDWATER FLOW DIRECTION INFORMATION
Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).

TOPOGRAPHIC INFORMATION
Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

USGS TOPOGRAPHIC MAP ASSOCIATED WITH THIS SITE
Target Property: 2440073-H7 MOUNT VERNON, NY
Source: USGS 7.5 min quad index

GENERAL TOPOGRAPHIC GRADIENT AT TARGET PROPERTY
Target Property: General SE
Source: General Topographic Gradient has been determined from the USGS 1 Degree Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

HYDROLOGIC INFORMATION
Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

FEMA FLOOD ZONE
Target Property County: WESTCHESTER, NY
FEMA Flood Electronic Data: YES - refer to the Overview Map and Detail Map
Flood Plain Panel at Target Property: 3609220006C
Additional Panels in search area:
- 3609170003B
- 3609150001B
- 3609220007C
- 3609220008C
- 3609220009C

NATIONAL WETLAND INVENTORY
NWI Quad at Target Property: MOUNT VERNON
NWI Electronic Data Coverage: YES - refer to the Overview Map and Detail Map

HYDROGEOLOGIC INFORMATION
Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.
Site-Specific Hydrogeological Data:
Search Radius: 2.0 miles
Status: Not found

AQUIFLOW
Search Radius: 2.000 Miles.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

</tr>
</tbody>
</table>

GROUNDWATER FLOW VELOCITY INFORMATION
Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY
Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY
The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps. The following information is based on Soil Conservation Service STATSGO data.

* ©1996 Site-specific hydrogeological data gathered by CERCLIS Alerts, Inc., Bainbridge Island, WA. All rights reserved. All of the information and opinions presented are those of the cited EPA report(s), which were completed under a Comprehensive Environmental Response Compensation and Liability Information System (CERCLIS) investigation.
GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

OTHER SOIL TYPES IN AREA

Based on Soil Conservation Service STATSGO data, the following additional subordinate soil types may appear within the general area of target property.

Soil Surface Textures: fine sandy loam
Surficial Soil Types: fine sandy loam
Shallow Soil Types: No Other Soil Types
Deeper Soil Types: unweathered bedrock
                       stratified
                       gravelly - fine sandy loam
                       fine sandy loam

ADDITIONAL ENVIRONMENTAL RECORD SOURCES

According to ASTM E 1527-00, Section 7.2.2, "one or more additional state or local sources of environmental records may be checked, in the discretion of the environmental professional, to enhance and supplement federal and state sources... Factors to consider in determining which local or additional state records, if any, should be checked include (1) whether they are reasonably ascertainable, (2) whether they are sufficiently useful, accurate, and complete in light of the objective of the records review (see 7.1.1), and (3) whether they are obtained, pursuant to local, good commercial or customary practice." One of the record sources listed in Section 7.2.2 is water well information. Water well information can be used to assist the environmental professional in assessing sources that may impact groundwater flow direction, and in forming an opinion about the impact of contaminant migration on nearby drinking water wells.

HYDROLOGIC INFORMATION

Flood Zone Data: This data, available in select counties across the country, was obtained by EDR in 1999 from the Federal Emergency Management Agency (FEMA). Data depicts 100-year and 500-year flood zones as defined by FEMA.

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002 from the U.S. Fish and Wildlife Service.

HYDROGEOLOGIC INFORMATION

AQUIFLOW® Information System
Source: EDR proprietary database of groundwater flow information
EDR has developed the AQUIFLOW Information System (AIS) to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted to regulatory authorities at select sites and has extracted the date of the report, hydrogeologically determined groundwater flow direction and depth to water table information.

GEOLOGIC INFORMATION

Geologic Age and Rock Stratigraphic Unit

STATSGO: State Soil Geographic Database
The U.S. Department of Agriculture’s (USDA) Soil Conservation Service (SCS) leads the national Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

ADDITIONAL ENVIRONMENTAL RECORD SOURCES

FEDERAL WATER WELLS

PWS: Public Water Systems
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Public Water System data from the Federal Reporting Data System. A PWS is any water system which provides water to at least 25 people for at least 60 days annually. PWSs provide water from wells, rivers and other sources.

PWS ENF: Public Water Systems Violation and Enforcement Data
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750

USGS Water Wells: In November 1971 the United States Geological Survey (USGS) implemented a national water resource information tracking system. This database contains descriptive information on sites where the USGS collects or has collected data on surface water and/or groundwater. The groundwater data includes information on more than 900,000 wells, springs, and other sources of groundwater.
STATE RECORDS

New York Public Water Wells
Source: New York Department of Health
Telephone: 518-458-6731

New York Facility and Manifest Data
Source: NYSDEC
Telephone: 518-457-6585
Facility and manifest data. Manifest is a document that lists and tracks hazardous waste from the generator through transporters to a tsd facility.

RADON

New York Radon Basement Screening Results

1.0 SUMMARY FINDINGS AND CONCLUSIONS

A Phase I Environmental Site Assessment has been undertaken for the property located at 229 Main Street (City Yard), New Rochelle, New York. The Assessment was conducted during the period of October 14, to November 11, 1994 by professional staff at Kaselaan & D'Angelo Associates, Inc. The Site Reconnaissance was conducted on October 26, November 9 and 10, and the report written by Mr. Phillip J. Fallon, Jr. The Phase I Environmental Site Assessment was conducted in accordance with ASTM Standard Practice E 1527-93.

This site is a 6.47 acre parcel with six separate one-story structures of various construction. The current use of the property is for activities of New Rochelle's Department of Public Works. In general, this includes parking, maintenance, washing, fueling and repair of City vehicles (except those of the Fire Department), and as offices and staging area for the DPW's activities. It is also used as a transfer station for recyclables and for the storage of salt and sand.

The history of use of this site has been as a staging are for the City's DPW since at least 1917, and possibly before. The site had a Sewage Disposal plant and has had a sewer right-of-way since at least 1911. Prior to this time, the site had a boat house (1911) and an ice house (1867).

A number of activities on site involve the use of hazardous materials, and the generation of hazardous waste. These are principally associated with vehicle cleaning and repair, but also include the use of insecticides and weed killers, and of paint and paint solvents. The long term use of this facility for the storage and repair of vehicles, and the appearance of the soils in topographic lows, especially where paving is absent, suggests the possibility of buildup of petroleum hydrocarbons and other contaminants in soils in localized areas.

As many as 14 tanks may present on the property (two of which are not underground) which need tank tightness test data to ascertain their integrity.

Westchester Department of Health and New York State Department of Environmental Conservation, Region 3, files review is pending.
2.0 INTRODUCTION

2.1 Purpose
This report presents the results of the Phase I Environmental Site Assessment (ESA) of the property located at 229 Main Street (City Yard), New Rochelle, New York. This ESA was performed by Kaselaan & D'Angelo Associates, Inc. at the request of the Department of Development of the City of New Rochelle.

The purpose of this assessment was to determine whether there are "recognized environmental conditions" on the property which may have an impact on the use or future sale of the property and liability of the client. (See definition of "recognized environmental conditions" in Section 2.4 below.) Evidence for recognized environmental conditions were sought through environmental and historical records searches, interviews, and a site reconnaissance.

The site reconnaissance was conducted with the presence of Mr. Richard Fevang, Fleet Manager, Mr. Ivory Green of the Department of Sewers and Drains, and Mr. Thomas McKnight of the Department of Streets and Highways.

2.2 Limiting Conditions and Methodology Used
This report is the culmination of an investigation whose purpose was to identify recognized environmental conditions on the property, using the methodology recommended by the American Society for Testing and Materials (ASTM). This methodology is referred to as Standard Practice E 1527.

"Recognized environmental conditions" are defined as the presence or likely presence of any hazardous substances or petroleum products on a property under conditions that indicate an existing release, a past release, or a material threat of a release of any hazardous substances or petroleum products into structures on the property or into the ground, groundwater or surface water of the property.

The site reconnaissance included an inspection of most of the structures on the property, as well as the grounds. The only structure not entered was the former Compost Building.

There were no other physical limitations, or obstructions which prevented the full inspection of the property.

No previous environmental site assessments were available for this assessment.
3.0 SITE DESCRIPTION

3.1 Location and Description
The property is located in the City of New Rochelle, New York (Westchester County), across from where Stephenson Boulevard joins Main Street (See Figure 3.1).

The property is an irregular parcel of land (6.47 acres) lying between Main Street and Echo Bay which is used by the City’s Department of Public Works.

The property listed as Section 1 Block 84 Lot 5 in the records of the Bureau of Buildings. It is bounded by Main Street on the North, 210/218 Main Street on the east, Echo Bay on the south, and the New York State Armory on the south.

3.2 Site and Vicinity Characteristics
This site has six buildings:

- Carpentry Shop;
- Sewers & Drains, Streets & Highways, and Sanitation (long, segmented L-shaped building);
- Compost Building;
- Machinery/Car Storage;
- Repair Garage; and
- Bookmobile Storage Building.

The subject site is zoned M-1 and M-3, which is industrial (See Figure 3.2). Adjoining property is the same. The vicinity, across Main Street is Business District, zoned C-1 and C-3.

3.3 Descriptions of Structures, Roads, Other Improvements on the Site (including heating/cooling system, sewage disposal, source of potable water)

3.3.1 General Site Setting

General Description of Structures
The property has six buildings having a total of 53,717 square feet (See Figure 3.3):
Area Zoning

Figure 3.2
• Carpentry Shop (one story brick and wood);
• Sewers & Drains, Streets & Highways, and Sanitation (long, segmented L-shaped building which is one story brick and wood);
• Compost Building (one story with basement field stone);
• Machinery/Car Storage (one story steel truss and field stone);
• Repair Garage with fuel pump island (one story steel); and
• Bookmobile Storage Building (one story cinderblock).

Other structures include:

• Wood bins for the storage of road salt, sand, and gravel;
• Concrete block wall for retaining recyclables on transfer floor;
• Vehicle wash station with water tank;
• Liquid salt tank; and
• Four concrete sewer structures which are part of the sewer main system passing through the property.

Fencing runs along most of the northern side of the property, and all along the eastern boundary. The western side is partially bounded by a dry stone retaining wall.

The property is irregularly paved with asphalt — mostly the central court area leading to the repair bays and about halfway to the property edge. Figure 3.3 illustrates the extent of the paved surface. The remaining area is covered with bluestone, or is just bare soil.

Roads
The property has two access driveways to Main Street. On-site paved surfaces or bluestone surfaced ground allow vehicles to move freely to the various facilities. There are no through-roads on the property.

Potable Water Supply
Potable water is supplied by the municipal system; there are no water supply wells on the property.

Sewage Disposal System
Sewage disposal is to the municipal sewage system.
3.3.2 Interior Observations

Heating/Cooling

- Carpentry Shop: two overhead fan heaters, hot water fed from the boiler in the basement of the Streets & Highways office. Also, three hot water radiators fed from the same boiler;

- Sewers & Drains, Streets & Highways, and Sanitation (long, segmented L-shaped building): various overhead fan heaters and radiators, hot water fed, in the different shops and offices. These are fed from boiler in the Streets & Highways office and by the boiler behind the Sewer & Drain Division portion of this building;

- Compost Building: boiler present, probably unused;

- Machinery/Car Storage: one overhead fan unit supplied with hot water from the compost building, probably unused;

- Repair Garage: six overhead fan units supplied with hot water from boiler located in the same building;

- Bookmobile Storage Building: unheated.

All boilers are oil-fired. It is not known if the boiler in the Compost Building is functional.

Cooling is via individual electric-powered wall units in only a few of the offices in these buildings. There is no central cooling equipment.

Stains or Corrosion

The interior of the buildings were checked for evidence of stains. Most of the buildings have been used for automotive repair for a good number of years. This is obvious by the discoloration (oil staining) of floor surfaces where there is repair or vehicle/equipment storage. This is not in of itself a concern except possibly where there are drains or sloped surfaces where oil or other vehicular fluids could runoff to the ground. See the discussion in the next section regarding drains.

- Carpentry Shop: floors discolored from past automotive repair; some slight staining from paints and wood stains but no drains;
• Sewers & Drains, Streets & Highways, and Sanitation (long, segmented L-shaped building). This building has a number of different functional areas:

- Streets & Highways Office: no staining;
- Basement (boiler room): oil seepage (standing oil) around base of 550-gallon vaulted tank;
- Back locker room: no staining;
- Central Stock Room: no significant staining;
- "OSHA Shed" (hazardous materials storage): no significant staining;
- Broom Shed: floor oil stained;
- Sanitation Office: no staining;
- Sewers & Drains Sitting Room: no staining;
- Parking Garage: floor oil stained;
- Equipment Garage: floor oil stained; and
- Locker Room/Kitchen/Bathroom: no staining.

• Compost Building: not inspected.

• Machinery/Car Storage: oil stained, standing water was observed in the center of the floor of this structure;

• Repair Garage: floor is oil stained (french drains run throughout this structure to collect fluid runoff. A number of areas had standing pools of oil or other fluids, mostly around active repair stations and around the waste oil fill pipe;

• Bookmobile Storage Building: floor has spilled cement mix; equipment and forms did not allow for close inspection of this facility.

Drains and Sumps
Drains are of significance when they lead to on-site cesspools, leaching pools, dry wells, or otherwise direct fluids to the soils of the property (or are clogged and permit fluids to runoff to the ground instead of to the municipal sewer system).

The connection of some of these drains is pending construction drawings review at the Department of Public Works:

• Carpentry Shop: no drains observed;

• Sewers & Drains, Streets & Highways, and Sanitation (long, segmented L-shaped
Some of this building's functional areas have drains:

- Streets & Highways Office basement (boiler room): has a drain used to dispose of boiler water blowoff; the drain connection is not known;
- Broom Shed: floor jack pits may receive fluids; however these are not connected to anything;
- Parking Garage: one large central drain in front of the central bay; the drain connection not known; and
- Equipment Garage: two floor drains near the front of the bays; the drain connection is not known;

- Compost Building: not inspected;

- Machinery/Car Storage: no drains observed;

- Repair Garage: two long french drains traverse the length of the building. There is also one in a small separate room on the northeast corner of the building. These are not connected to anything; they are periodically cleaned by shovelling. Two other small drains were observed on the open floor: in the battery charging pen, and just outside this pen. Two drains are located in the boiler room. The connection of these drains is not known; and

- Bookmobile Storage Building: no drains observed.

### 3.3.3 Exterior Observations

**Pits, Ponds or Lagoons**
No pits, ponds or lagoons were observed on the property.

**Stained Soil or Pavement**
The property was examined for evidence of stained soil or pavement. Because of the long use of this facility for the repair, storage, washing and parking of vehicles, oil staining is present in areas where there is a lot of vehicular traffic. Only areas where oil or other hazardous materials are suspected to have collected based on visual observation made during the site reconnaissance, are noted here:

- Oil stained soil along Echo Bay edge of property, south side beyond salt and sand storage bins (see photo in Figure 3.4);
• Stained soil around outside drum storage areas: south side of the Bookmobile storage shed, and south side of the Repair Garage (see photo in Figure 3.4);
• Stained soil in depression off the southwest corner of the Compost Building, and soil outside the overhead door on the northwest corner of the Repair Garage (see photo in Figure 3.5); and
• Ground around the vehicle wash area (see photo in Figure 3.5).

**Stressed Vegetation**
Vegetated areas exist around the periphery of the property; some stressed vegetation was observed off the side of the Bookmobile storage shed (See photo in Figure 3.6).

**Solid Waste**
Solid waste is not clandestinely dumped on the side; however, piles of what appears to be trash is located on the south side of the Bookmobile Storage Shed, as well as discarded batteries (see photo in Figure 3.6).

This property is also used to stockpile wood chippings and leaves (see photos in Figure 3.7).

**Waste Water**
Wastewater is generated in the cleaning of the vehicles at the vehicle wash station (see photo in Figure 3.5). It is not known where the wash water goes.

**Wells**
No wells were observed.

**Septic Systems**
Sewage is disposed into the municipal sewage system.

3.4 **Information (if any) Reported by User Regarding Environmental Liens or Specialized Knowledge or Experience**
No information regarding liens or contamination known to the City has been available for this assessment.
Stained Soil Along Edge of Property (Upper Photo)
Stained Soil Around Outside of Drum Storage Area (Lower Photo)
Stained Soil Outside Repair Garage Overhead Door (Upper Photo)
Stained Ground Around Vehicle Wash Area (Lower Photo)
Stressed Vegetation Off South Side of Bookmobile Building (Upper Photo)
Solid Waste Off South Side of Bookmobile Building (Lower Photo)

Figure 3.6
Leaf Compost Pile in Central Yard (Upper Photo)
Wood Chip Pile on Southeast Edge of Yard (Lower Photo)

Figure 3.7
3.5 Current Uses of the Property

The current use of the property is for activities of New Rochelle's Department of Public Works. In general, this includes parking, maintenance, washing, fueling and repair of City vehicles (except those of the Fire Department), and as offices and staging area for the DPW's activities. It is also used as a transfer station for recyclables and for the storage of salt and sand.

Observed and inferred activities, by site location, are as follows:

- Carpentry Shop: several pieces of light duty carpentry equipment (table saw, drill press, etc.) and the general clutter throughout the shop indicate that only repair of wood objects and small construction projects are performed here. Numerous gallon, quart, pint and spray cans of thinners, paints, stains, glues, are scattered throughout the shop.

- Sewers & Drains, Streets & Highways, and Sanitation (long, segmented L-shaped building): This building has a number of different functional areas:
  - Streets & Highways Office: administration offices, lunch room, locker room, and toilets; basement: boiler room;
  - Back Locker Room: locker room and toilet;
  - Central Stock Room: storage of DPW supplies;
  - "OSHA Shed": hazardous materials storage;
  - Broom Shed: construction of brooms for street sweepers, and storage of small equipment;
  - Sanitation Office: office;
  - Sewers & Drains Sitting Room: lockers and tables;
  - Parking Garage: truck parking and some equipment storage;
  - Equipment Garage: staging, small equipment storage (snow blowers, portable compressors and winches) and preparation of equipment;
  - Locker Room/Kitchen/Bathroom: personnel facilities;

- Compost Building: not inspected.

- Machinery/Car Storage: parking of cars, and City vehicles; snow plow storage;

- Repair Garage: repair of City vehicles. Includes welding, battery recharging, fluid changes, and general vehicle repair. There are at least a dozen repair stations, most of which have an in-floor vehicle exhaust system port (there are two ceiling-
mounted fans to provide negative air flow from the floor hookups. There are three stations with compressed air lifts for light-duty vehicles, and two stations with hydraulic lifts for heavy-duty vehicle repair. This building also has offices, bathrooms, a lunch room and a locker room.

Outside, on the west side of the building, are three fuel dispensers: two unleaded gasoline and one diesel.

- Bookmobile storage shed: storage of cement mixers, bags of cement, and forms.

The yard is used for a number of different purposes:

- Northwest corner: transfer of recyclables. Trucks bring the recyclables in and deposit them in this area. They are then put into roll-offs for transport off-site;

- East side, south of Bookmobile Storage Building: storage of sand, salt, and gravel;

- Central area: vehicle wash station. An asphalt pad with two drains collect wash water. A berm on the downhill side of this pad prevents runoff from the pad to the yard. Also in this area is a large plastic liquid salt storage tank; and

- Southeast and northeast areas: vehicle parking.

This site also has a large sewage main right-of-way; some of the associated structures (concrete block houses) bisect the yard about midway.

### 3.6 Past Uses of the Property

The property has been used by the DPW since at least 1917. In addition to the uses noted in Section 3.5 above, there was a small sewage disposal plant on the property.

### 3.7 Current and Past Uses of Adjoining Properties

Current adjoining property use is industrial:

North: Main Street;

East: 216/218 Main Street: Auto repair shop;
South:   Echo Bay; and

West:   New York State Armory property.

None of these adjoining property uses are likely to be a significant source of hazardous substances contamination to the property.

Past uses, as evidenced by a study of Sanborn maps, has been as follows:

210/218 Main Street:
- 1911:   Unoccupied one-story structure
- 1931:   One-story "Auto Sales & Service" building (different than that shown in 1911;
- 1951:   Same as 1931; and
- 1990:   Same structure, labeled "Auto Repair & Fire Sales & Service".

This use has most likely involved the use of hazardous materials, and generation of hazardous waste (waste oil).

New York State Armory Property:
- 1911:   Residential;
- 1931:   Same as 1911, except that a few more sheds are present;
- 1951:   "Naval Militia Armory", "Drill Shed", and "Class Rooms" noted as constructed in 1938; and
- 1990:   Same as 1951.

This past use is not likely to have involved the use, storage, or generation of significant quantities of hazardous materials.

3.8 Site Rendering, Map or Site Plan
A sketch of the site showing the structures, paved surfaces and boundaries is presented in Figure 3.3. Other site plans have been provided by the City for this investigation but are not presented in this report.
4.0 RECORDS REVIEW

4.1 Standard Environmental Record Sources, Federal and State

The environmental records review allows for discovery of what is known about the presence or potential presence of hazardous substances on the property. Hazardous substances were those contaminants that are within the scope of the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA), and petroleum products.

A database search of state and Federal databases was ordered and received from Toxics Targeting, Inc. The following are standard environmental record sources, Federal and State, and the approximate minimum search distance employed for each, as required by Standard Practice E 1527:

<table>
<thead>
<tr>
<th>Record (Date of Last Update)</th>
<th>Approx. Minimum Search Distance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Federal NPL Site List (05/94)</td>
<td>1.0 mi/1.6 km</td>
</tr>
<tr>
<td>Federal CERCLIS List (06/93)</td>
<td>0.5 mi/0.8 km</td>
</tr>
<tr>
<td>Federal RCRA TSD Facilities (10/93)</td>
<td>1.0 mi/1.6 km</td>
</tr>
<tr>

</tr>
</tbody>
</table>

Each of the categories of occurrences noted above, of which there are five, is discussed below. All occurrences are plotted in Figures 4.1a through 4.1c. A copy of the Toxics Targeting, Inc. report appears in Appendix 9.1.

4.1.1 Federal CERCLIS List

The CERCLIS List is a compilation by the EPA of the sites which the EPA has investigated or is currently investigating for a release or threatened release of hazardous substances pursuant to the Comprehensive Environmental Response, Compensation and Liability Act of 1980 (Superfund Act).

There was a single entry in this database that lies about 1,000 feet south of the subject property (map symbol number 1 in Figure 4.1a). It is the Con Edison Echo Avenue substation, located on Echo Avenue, New Rochelle, New York. The site is approximately 150 x 600 feet and is bounded by a fuel oil dealer, a tidal creek, Echo Bay, and private residences. PCBs have been found in soils and catch basin sediments, and on surfaces within structures. Considerable cleanup of PCBs has already occurred. Potentially contaminated tideland sediments could expose wildlife, fish and residents to PCBs.

This site is not likely to be a significant source of contamination to the subject property because of its isolation by an extension of Echo Bay. Also, groundwater contamination has not been reported.
1/4 Mile Radius Map Showing Identified Listed Sites

Figure 4.1a
One Mile Radius Map Showing Identified Listed Sites

Figure 4.1c
4.1.2 Federal RCRA Generators List
RCRA Large Quantity Generators are facilities which generate at least 1,000 kg/month of acutely hazardous waste. Small and Very Small Quantity Generators generate less than 1,000 kg/month.

Two facilities have been identified that are within the search radius: the subject property and Orsini Brothers, or J & M Auto Works, located on the adjoining property to the east (214 Main Street).

This facility (Facility ID NYD981567357), a small quantity generator, reported generating 255 gallons of non-halogenated solvents in 1991 (none reported for 1992 and 1993). This facility is not reported in the RCRA Administrative Action Tracking System (RAATS). It is unlikely that this facility would be significant source of contamination because it is cross gradient (with respect to groundwater flow) to the subject property.

The subject property (Facility ID NYP000776153) is listed in the database but no hazardous waste activity has been reported for the period of 1/89 to 7/93.

No Large Quantity Generators were found on or adjoining the property in this database search.

4.1.3 New York State Inactive Hazardous Waste Disposal Sites
State hazardous waste sites records are the states' equivalent to CERCLIS. These sites may or may not already be listed on the Federal CERCLIS list. Priority sites planned for cleanup using state funds (state equivalent of Superfund) are identified in the database along with sites where cleanup will be paid by potentially responsible parties.

One site has been identified that are within the search radius: the Con Edison Echo Bay facility which has been discussed in Section 4.1.1 above.

4.1.4 New York Leaking Underground Storage Tanks and Other Spills
This database contains information collected on spills reported to the NYSDEC as required by one or more of the following: Article 12 of the Navigation Law, 6 NYCRR Section 613.8 (from Petroleum Bulk Storage Regulations) or 6 NYCRR Section 595.2 (from Chemical Bulk Storage Regulations). The database includes active (unremediated) and inactive (remediated) spills.

1.0 SUMMARY FINDINGS AND CONCLUSIONS

A Phase I Environmental Site Assessment has been undertaken for the property located at 229 Main Street (City Yard), New Rochelle, New York. The Assessment was conducted during the period of October 14, to November 11, 1994 by professional staff at Kaselaan & D'Angelo Associates, Inc. The Site Reconnaissance was conducted on October 26, November 9 and 10, and the report written by Mr. Phillip J. Fallon, Jr. The Phase I Environmental Site Assessment was conducted in accordance with ASTM Standard Practice E 1527-93.

This site is a 6.47 acre parcel with six separate one-story structures of various construction. The current use of the property is for activities of New Rochelle's Department of Public Works. In general, this includes parking, maintenance, washing, fueling and repair of City vehicles (except those of the Fire Department), and as offices and staging area for the DPW's activities. It is also used as a transfer station for recyclables and for the storage of salt and sand.

The history of use of this site has been as a staging area for the City's DPW since at least 1917, and possibly before. The site had a Sewage Disposal plant and has had a sewer right-of-way since at least 1911. Prior to this time, the site had a boat house (1911) and an ice house (1867).

A number of activities on site involve the use of hazardous materials, and the generation of hazardous waste. These are principally associated with vehicle cleaning and repair, but also include the use of insecticides and weed killers, and of paint and paint solvents. The long term use of this facility for the storage and repair of vehicles, and the appearance of the soils in topographic lows, especially where paving is absent, suggests the possibility of buildup of petroleum hydrocarbons and other contaminants in soils in localized areas.

As many as 14 tanks may present on the property (two of which are not underground) which need tank tightness test data to ascertain their integrity.

Westchester Department of Health and New York State Department of Environmental Conservation, Region 3, files review is pending.
2.0 INTRODUCTION

2.1 Purpose
This report presents the results of the Phase I Environmental Site Assessment (ESA) of the property located at 229 Main Street (City Yard), New Rochelle, New York. This ESA was performed by Kaselaan & D’Angelo Associates, Inc. at the request of the Department of Development of the City of New Rochelle.

The purpose of this assessment was to determine whether there are "recognized environmental conditions" on the property which may have an impact on the use or future sale of the property and liability of the client. (See definition of "recognized environmental conditions" in Section 2.4 below.) Evidence for recognized environmental conditions were sought through environmental and historical records searches, interviews, and a site reconnaissance.

The site reconnaissance was conducted with the presence of Mr. Richard Fevang, Fleet Manager, Mr. Ivory Green of the Department of Sewers and Drains, and Mr. Thomas McKnight of the Department of Streets and Highways.

2.2 Limiting Conditions and Methodology Used
This report is the culmination of an investigation whose purpose was to identify recognized environmental conditions on the property, using the methodology recommended by the American Society for Testing and Materials (ASTM). This methodology is referred to as Standard Practice E 1527.

"Recognized environmental conditions" are defined as the presence or likely presence of any hazardous substances or petroleum products on a property under conditions that indicate an existing release, a past release, or a material threat of a release of any hazardous substances or petroleum products into structures on the property or into the ground, groundwater or surface water of the property.

The site reconnaissance included an inspection of most of the structures on the property, as well as the grounds. The only structure not entered was the former Compost Building.

There were no other physical limitations, or obstructions which prevented the full inspection of the property.

No previous environmental site assessments were available for this assessment.
3.0 SITE DESCRIPTION

3.1 Location and Description
The property is located in the City of New Rochelle, New York (Westchester County), across from where Stephenson Boulevard joins Main Street (See Figure 3.1).

The property is an irregular parcel of land (6.47 acres) lying between Main Street and Echo Bay which is used by the City’s Department of Public Works.

The property listed as Section 1 Block 84 Lot 5 in the records of the Bureau of Buildings. It is bounded by Main Street on the North, 210/218 Main Street on the east, Echo Bay on the south, and the New York State Armory on the south.

3.2 Site and Vicinity Characteristics
This site has six buildings:

- Carpentry Shop;
- Sewers & Drains, Streets & Highways, and Sanitation (long, segmented L-shaped building);
- Compost Building;
- Machinery/Car Storage;
- Repair Garage; and
- Bookmobile Storage Building.

The subject site is zoned M-1 and M-3, which is industrial (See Figure 3.2). Adjoining property is the same. The vicinity, across Main Street is Business District, zoned C-1 and C-3.

3.3 Descriptions of Structures, Roads, Other Improvements on the Site (including heating/cooling system, sewage disposal, source of potable water)

3.3.1 General Site Setting

General Description of Structures
The property has six buildings having a total of 53,717 square feet (See Figure 3.3):
Site Location With One-Mile Radius Circle

Figure 3.1
• Carpentry Shop (one story brick and wood);
• Sewers & Drains, Streets & Highways, and Sanitation (long, segmented L-shaped building which is one story brick and wood);
• Compost Building (one story with basement field stone);
• Machinery/Car Storage (one story steel truss and field stone);
• Repair Garage with fuel pump island (one story steel); and
• Bookmobile Storage Building (one story cinderblock).

Other structures include:

• Wood bins for the storage of road salt, sand, and gravel;
• Concrete block wall for retaining recyclables on transfer floor;
• Vehicle wash station with water tank;
• Liquid salt tank; and
• Four concrete sewer structures which are part of the sewer main system passing through the property.

Fencing runs along most of the northern side of the property, and all along the eastern boundary. The western side is partially bounded by a dry stone retaining wall.

The property is irregularly paved with asphalt — mostly the central court area leading to the repair bays and about halfway to the property edge. Figure 3.3 illustrates the extent of the paved surface. The remaining area is covered with bluestone, or is just bare soil.

Roads
The property has two access driveways to Main Street. On-site paved surfaces or bluestone surfaced ground allow vehicles to move freely to the various facilities. There are no through-roads on the property.

Potable Water Supply
Potable water is supplied by the municipal system; there are no water supply wells on the property.

Sewage Disposal System
Sewage disposal is to the municipal sewage system.
3.3.2 Interior Observations

Heating/Cooling

- Carpentry Shop: two overhead fan heaters, hot water fed from the boiler in the basement of the Streets & Highways office. Also, three hot water radiators fed from the same boiler;

- Sewers & Drains, Streets & Highways, and Sanitation (long, segmented L-shaped building): various overhead fan heaters and radiators, hot water fed, in the different shops and offices. These are fed from boiler in the Streets & Highways office and by the boiler behind the Sewer & Drain Division portion of this building;

- Compost Building: boiler present, probably unused;

- Machinery/Car Storage: one overhead fan unit supplied with hot water from the compost building, probably unused;

- Repair Garage: six overhead fan units supplied with hot water from boiler located in the same building;

- Bookmobile Storage Building: unheated.

All boilers are oil-fired. It is not known if the boiler in the Compost Building is functional.

Cooling is via individual electric-powered wall units in only a few of the offices in these buildings. There is no central cooling equipment.

Stains or Corrosion

The interior of the buildings were checked for evidence of stains. Most of the buildings have been used for automotive repair for a good number of years. This is obvious by the discoloration (oil staining) of floor surfaces where there is repair or vehicle/equipment storage. This is not in of itself a concern except possibly where there are drains or sloped surfaces where oil or other vehicular fluids could runoff to the ground. See the discussion in the next section regarding drains.

- Carpentry Shop: floors discolored from past automotive repair; some slight staining from paints and wood stains but no drains;
• Sewers & Drains, Streets & Highways, and Sanitation (long, segmented L-shaped building). This building has a number of different functional areas:
  - Streets & Highways Office: no staining;
  - Basement (boiler room): oil seepage (standing oil) around base of 550-gallon vaulted tank;
  - Back locker room: no staining;
  - Central Stock Room: no significant staining;
  - "OSHA Shed" (hazardous materials storage): no significant staining;
  - Broom Shed: floor oil stained;
  - Sanitation Office: no staining;
  - Sewers & Drains Sitting Room: no staining;
  - Parking Garage: floor oil stained;
  - Equipment Garage: floor oil stained; and
  - Locker Room/Kitchen/Bathroom: no staining.

• Compost Building: not inspected.

• Machinery/Car Storage: oil stained, standing water was observed in the center of the floor of this structure;

• Repair Garage: floor is oil stained (french drains run throughout this structure to collect fluid runoff. A number of areas had standing pools of oil or other fluids, mostly around active repair stations and around the waste oil fill pipe;

• Bookmobile Storage Building: floor has spilled cement mix; equipment and forms did not allow for close inspection of this facility.

**Drains and Sumps**

Drains are of significance when they lead to on-site cesspools, leaching pools, dry wells, or otherwise direct fluids to the soils of the property (or are clogged and permit fluids to runoff to the ground instead of to the municipal sewer system).

The connection of some of these drains is pending construction drawings review at the Department of Public Works:

• Carpentry Shop: no drains observed;

• Sewers & Drains, Streets & Highways, and Sanitation (long, segmented L-shaped
building): Some of this building’s functional areas have drains:

- Streets & Highways Office basement (boiler room): has a drain used to dispose of boiler water blowoff; the drain connection is not known;
- Broom Shed: floor jack pits may receive fluids; however these are not connected to anything;
- Parking Garage: one large central drain in front of the central bay; the drain connection not known; and
- Equipment Garage: two floor drains near the front of the bays; the drain connection is not known;

- Compost Building: not inspected;

- Machinery/Car Storage: no drains observed;

- Repair Garage: two long french drains traverse the length of the building. There is also one in a small separate room on the northeast corner of the building. These are not connected to anything; they are periodically cleaned by shovelling. Two other small drains were observed on the open floor: in the battery charging pen, and just outside this pen. Two drains are located in the boiler room. The connection of these drains is not known; and

- Bookmobile Storage Building: no drains observed.

3.3.3 Exterior Observations

Pits, Ponds or Lagoons
No pits, ponds or lagoons were observed on the property.

Stained Soil or Pavement
The property was examined for evidence of stained soil or pavement. Because of the long use of this facility for the repair, storage, washing and parking of vehicles, oil staining is present in areas where there is a lot of vehicular traffic. Only areas where oil or other hazardous materials are suspected to have collected based on visual observation made during the site reconnaissance, are noted here:

- Oil stained soil along Echo Bay edge of property, south side beyond salt and sand storage bins (see photo in Figure 3.4);
• Stained soil around outside drum storage areas: south side of the Bookmobile storage shed, and south side of the Repair Garage (see photo in Figure 3.4);
• Stained soil in depression off the southwest corner of the Compost Building, and soil outside the overhead door on the northwest corner of the Repair Garage (see photo in Figure 3.5); and
• Ground around the vehicle wash area (see photo in Figure 3.5).

**Stressed Vegetation**

Vegetated areas exist around the periphery of the property; some stressed vegetation was observed off the side of the Bookmobile storage shed (See photo in Figure 3.6).

**Solid Waste**

Solid waste is not clandestinely dumped on the side; however, piles of what appears to be trash is located on the south side of the Bookmobile Storage Shed, as well as discarded batteries (see photo in Figure 3.6).

This property is also used to stockpile wood chippings and leaves (see photos in Figure 3.7).

**Waste Water**

Wastewater is generated in the cleaning of the vehicles at the vehicle wash station (see photo in Figure 3.5). It is not known where the wash water goes.

**Wells**

No wells were observed.

**Septic Systems**

Sewage is disposed into the municipal sewage system.

### 3.4 Information (if any) Reported by User Regarding Environmental Liens or Specialized Knowledge or Experience

No information regarding liens or contamination known to the City has been available for this assessment.
Stained Soil Along Edge of Property (Upper Photo)
Stained Soil Around Outside of Drum Storage Area (Lower Photo)

Figure 3.4

Stressed Vegetation Off South Side of Bookmobile Building (Upper Photo)
Solid Waste Off South Side of Bookmobile Building (Lower Photo)
Leaf Compost Pile in Central Yard (Upper Photo)
Wood Chip Pile on Southeast Edge of Yard (Lower Photo)

Figure 3.7
3.5 Current Uses of the Property

The current use of the property is for activities of New Rochelle's Department of Public Works. In general, this includes parking, maintenance, washing, fueling and repair of City vehicles (except those of the Fire Department), and as offices and staging area for the DPW's activities. It is also used as a transfer station for recyclables and for the storage of salt and sand.

Observed and inferred activities, by site location, are as follows:

- Carpentry Shop: several pieces of light duty carpentry equipment (table saw, drill press, etc.) and the general clutter throughout the shop indicate that only repair of wood objects and small construction projects are performed here. Numerous gallon, quart, pint and spray cans of thinners, paints, stains, glues, are scattered throughout the shop.

- Sewers & Drains, Streets & Highways, and Sanitation (long, segmented L-shaped building): This building has a number of different functional areas:
  - Streets & Highways Office: administration offices, lunch room, locker room, and toilets; basement: boiler room;
  - Back Locker Room: locker room and toilet;
  - Central Stock Room: storage of DPW supplies;
  - "OSHA Shed": hazardous materials storage;
  - Broom Shed: construction of brooms for street sweepers, and storage of small equipment;
  - Sanitation Office: office;
  - Sewers & Drains Sitting Room: lockers and tables;
  - Parking Garage: truck parking and some equipment storage;
  - Equipment Garage: staging, small equipment storage (snow blowers, portable compressors and winches) and preparation of equipment;
  - Locker Room/Kitchen/Bathroom: personnel facilities;

- Compost Building: not inspected.

- Machinery/Car Storage: parking of cars, and City vehicles; snow plow storage;

- Repair Garage: repair of City vehicles. Includes welding, battery recharging, fluid changes, and general vehicle repair. There are at least a dozen repair stations, most of which have an in-floor vehicle exhaust system port (there are two ceiling-
mounted fans to provide negative air flow from the floor hookups. There are three stations with compressed air lifts for light-duty vehicles, and two stations with hydraulic lifts for heavy-duty vehicle repair. This building also has offices, bathrooms, a lunch room and a locker room.

Outside, on the west side of the building, are three fuel dispensers: two unleaded gasoline and one diesel.

- Bookmobile storage shed: storage of cement mixers, bags of cement, and forms.

The yard is used for a number of different purposes:

- Northwest corner: transfer of recyclables. Trucks bring the recyclables in and deposit them in this area. They are then put into roll-offs for transport off-site;

- East side, south of Bookmobile Storage Building: storage of sand, salt, and gravel;

- Central area: vehicle wash station. An asphalt pad with two drains collect wash water. A berm on the downhill side of this pad prevents runoff from the pad to the yard. Also in this area is a large plastic liquid salt storage tank; and

- Southeast and northeast areas: vehicle parking.

This site also has a large sewage main right-of-way; some of the associated structures (concrete block houses) bisect the yard about midway.

3.6 Past Uses of the Property
The property has been used by the DPW since at least 1917. In addition to the uses noted in Section 3.5 above, there was a small sewage disposal plant on the property.

3.7 Current and Past Uses of Adjoining Properties
Current adjoining property use is industrial:

North: Main Street;

East: 216/218 Main Street: Auto repair shop;
South: Echo Bay; and

West: New York State Armory property.

None of these adjoining property uses are likely to be a significant source of hazardous substances contamination to the property.

Past uses, as evidenced by a study of Sanborn maps, has been as follows:

**210/218 Main Street:**
- 1911: Unoccupied one-story structure
- 1931: One-story "Auto Sales & Service" building (different than that shown in 1911;)
- 1951: Same as 1931; and
- 1990: Same structure, labeled "Auto Repair & Fire Sales & Service".

This use has most likely involved the use of hazardous materials, and generation of hazardous waste (waste oil).

**New York State Armory Property:**
- 1911: Residential;
- 1931: Same as 1911, except that a few more sheds are present;
- 1951: "Naval Militia Armory", "Drill Shed", and "Class Rooms" noted as constructed in 1938; and
- 1990: Same as 1951.

This past use is not likely to have involved the use, storage, or generation of significant quantities of hazardous materials.

**3.8 Site Rendering, Map or Site Plan**
A sketch of the site showing the structures, paved surfaces and boundaries is presented in Figure 3.3. Other site plans have been provided by the City for this investigation but are not presented in this report.
4.0 RECORDS REVIEW

4.1 Standard Environmental Record Sources, Federal and State

The environmental records review allows for discovery of what is known about the presence or potential presence of hazardous substances on the property. Hazardous substances were those contaminants that are within the scope of the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA), and petroleum products.

A database search of state and Federal databases was ordered and received from Toxics Targeting, Inc. The following are standard environmental record sources, Federal and State, and the approximate minimum search distance employed for each, as required by Standard Practice E 1527:

<table>
<thead>
<tr>
<th>Record (Date of Last Update)</th>
<th>Approx. Minimum Search Distance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Federal NPL Site List (05/94)</td>
<td>1.0 mi/1.6 km</td>
</tr>
<tr>
<td>Federal CERCLIS List (06/93)</td>
<td>0.5 mi/0.8 km</td>
</tr>
<tr>
<td>Federal RCRA TSD Facilities (10/93)</td>
<td>1.0 mi/1.6 km</td>
</tr>
<tr>
<td>Federal ERNS List (12/93)</td>
<td>Prop. Only</td>
</tr>
<tr>
<td>New York Inactive Hazardous Waste Disposal Sites (7/93)</td>
<td>1.0 mi/1.6 km</td>
</tr>
<tr>
<td>New York SWF (06/93)</td>
<td>0.5 mi/0.8 km</td>
</tr>
<tr>
<td>New York LUSTs (03/94)</td>
<td>0.5 mi/0.8 km</td>
</tr>
<tr>
<td>New York PBSs (01/94)</td>
<td>Prop. &amp; Adjoining Prop.</td>
</tr>
</tbody>
</table>
The following number of occurrences of each facilities were found in the searched databases:

<table>
<thead>
<tr>
<th>Record</th>
<th>No. of Occurrences</th>
</tr>
</thead>
<tbody>
<tr>
<td>Federal NPL Site List</td>
<td>0</td>
</tr>
<tr>
<td>Federal CERCLIS List</td>
<td>1</td>

</tr>
<tr>
<td>New York MOSF</td>
<td>0</td>
</tr>
<tr>
<td>New York PBS</td>
<td>1</td>
</tr>
</tbody>
</table>

Each of the categories of occurrences noted above, of which there are five, is discussed below. All occurrences are plotted in Figures 4.1a through 4.1c. A copy of the Toxics Targeting, Inc. report appears in Appendix 9.1.

### 4.1.1 Federal CERCLIS List

The CERCLIS List is a compilation by the EPA of the sites which the EPA has investigated or is currently investigating for a release or threatened release of hazardous substances pursuant to the Comprehensive Environmental Response, Compensation and Liability Act of 1980 (Superfund Act).

There was a single entry in this database that lies about 1,000 feet south of the subject property (map symbol number 1 in Figure 4.1a). It is the Con Edison Echo Avenue substation, located on Echo Avenue, New Rochelle, New York. The site is approximately 150 x 600 feet and is bounded by a fuel oil dealer, a tidal creek, Echo Bay, and private residences. PCBs have been found in soils and catch basin sediments, and on surfaces within structures. Considerable cleanup of PCBs has already occurred. Potentially contaminated tideland sediments could expose wildlife, fish and residents to PCBs.

This site is not likely to be a significant source of contamination to the subject property because of its isolation by an extension of Echo Bay. Also, groundwater contamination has not been reported.
1/4 Mile Radius Map Showing Identified Listed Sites

Figure 4.1a
4.1.2 Federal RCRA Generators List

RCRA Large Quantity Generators are facilities which generate at least 1,000 kg/month of acutely hazardous waste. Small and Very Small Quantity Generators generate less than 1,000 kg/month.

Two facilities have been identified that are within the search radius: the subject property and Orsini Brothers, or J & M Auto Works, located on the adjoining property to the east (214 Main Street).

This facility (Facility ID NYD981567357), a small quantity generator, reported generating 255 gallons of non-halogenated solvents in 1991 (none reported for 1992 and 1993). This facility is not reported in the RCRA Administrative Action Tracking System (RAATS). It is unlikely that this facility would be significant source of contamination because it is cross gradient (with respect to groundwater flow) to the subject property.

The subject property (Facility ID NYP000776153) is listed in the database but no hazardous waste activity has been reported for the period of 1/89 to 7/93.

No Large Quantity Generators were found on or adjoining the property in this database search.

4.1.3 New York State Inactive Hazardous Waste Disposal Sites

State hazardous waste sites records are the states' equivalent to CERCLIS. These sites may or may not already be listed on the Federal CERCLIS list. Priority sites planned for cleanup using state funds (state equivalent of Superfund) are identified in the database along with sites where cleanup will be paid by potentially responsible parties.

One site has been identified that are within the search radius: the Con Edison Echo Bay facility which has been discussed in Section 4.1.1 above.

4.1.4 New York Leaking Underground Storage Tanks and Other Spills

This database contains information collected on spills reported to the NYSDEC as required by one or more of the following: Article 12 of the Navigation Law, 6 NYCRR Section 613.8 (from Petroleum Bulk Storage Regulations) or 6 NYCRR Section 595.2 (from Chemical Bulk Storage Regulations). The database includes active (unremediated) and inactive (remediated) spills.

© Toxics Targeting, Inc. 1994
Introduction

Toxics Targeting has combined environmental database searches, extensive regulatory analysis and sophisticated mapping techniques to produce your Computerized Environmental Report. It checks for the presence of 15 categories of government-reported toxic sites and provides detailed, up-to-date information on each identified site. The findings of your report are presented in an easy-to-understand format that:

1. Maps the approximate locations of selected government-reported toxic sites on or near a specified target address.
2. Estimates the distance between each reported toxic site and the target address.
3. Identifies air and water permit non-compliance and other regulatory violations.
4. Profiles some aspects of the usage, manufacture, storage, handling, transport or disposal of toxic chemicals at individual sites.
5. Summarizes some potential health effect information and drinking water standards for selected chemicals reported at individual sites.

The Three Sections Of Your Report

The first section highlights your report’s findings by: a) listing reported toxic sites by category, b) summarizing information about each site and noting its distance from the target address and c) providing five maps with varying search radii of the target address and all the reported toxic sites. One-mile, half-mile and quarter-mile radii maps illustrate the locations of toxic sites in the categories analyzed at those distances. Petroleum bulk storage (PBS) sites are presented on an quarter-mile radius map. Finally, a quarter-mile radius close-up map illustrates the locations of all reported toxic sites except PBS sites.

The second section of your report contains Toxic Site Profiles that provide detailed information on each reported toxic site. The information in each Toxic Site Profile varies according to its source. Some toxic site categories have extensive information, some have limited information. All the information is up-dated on a regular basis.

The third section of the report contains appendices that identify: 1) on-site remediated spills reported to New York State Authorities, 2) civil judiciary cases involving the target address filed on behalf of the Environmental Protection Agency by the Department of Justice, 3) on-site spills reported to the national Emergency Response Notification System (ERNS), 4) various toxic sites that cannot be mapped due to incomplete or erroneous addresses, 5) codes that characterize hazardous wastes reported at various facilities, 6) methods used to map toxic sites identified in your report and 7) information sources used in your report.

How to Use Your Report

Start by reviewing your report’s Summary Section. Check Table One to see which toxic site categories have sites identified in your report. Check Table Two for the approximate distance between each site and the target address as well as summary information on each toxic site. Refer to the five site maps to see the locations of the target address and each reported toxic site. If you find toxic sites of concern, refer to the Toxic Site Profile and Appendix sections for additional information on each one.
**Toxic Site Databases Analyzed In Your Report**

**Search Radius**

- **One-Mile**
  - National Priority List: toxic sites nominated for federal Superfund cleanup.
  - CERC-IS: sites included in the federal Comprehensive Environmental Response, Compensation and Liability Information System.
  - Inactive Hazardous Waste Disposal Facilities: dumps, landfills and other toxic sites listed by New York Environmental and Health authorities.
  - Solid Waste Facilities: landfills, incinerators, transfer stations and other sites that manage solid wastes.
  - Major Oil Storage Facilities: sites storing more than 400,000 gallons of petroleum products.
  - RCRA Hazardous Waste Treatment, Storage or Disposal Facilities: sites regulated under the Resource Conservation and Recovery Act that treat, store or disposal of wastes that can be toxic, flammable, corrosive, explosive or otherwise hazardous.
  - RCRA Hazardous Waste Generators or Transporters: sites regulated under the Resource Conservation and Recovery Act that generate or transport wastes that can be toxic, flammable, corrosive, explosive or otherwise hazardous.
  - Toxic Release Inventory Sites: toxic chemical releases into air, land or water reported pursuant to Section 313 of the Emergency Planning and Community Right-to-Know Act.
  - Air Discharges: selected sites releasing air pollutants.
  - Toxic Wastewater Discharges: sites discharging wastewaters with toxic chemicals.
  - Chemical Bulk Storage Facilities: sites storing bulk chemicals.
  - Petroleum Bulk Storage Facilities: above-ground and underground petroleum storage sites.

- **Quarter-Mile**

- **Half-Mile**

- **Property only**
  - Spills: active (unremediated) stationary source spills reported to state and federal agencies, including unremediated leaking underground storage tanks.
  - Spills: inactive (remediated) stationary and non-stationary source spills reported to state and federal agencies, including remediated leaking underground storage tanks.
  - ERNS: spills reported to the federal Emergency Response Notification System.

- **Property only**
  - USEPA Civil Enforcement Docket: civil judiciary cases filed on behalf of the Environmental Protection Agency by the Department of Justice.
A Note Regarding The Information In Your Report

The information presented in your Computerized Environmental Report has been obtained from various local, state and federal government agencies. Please be aware that: 1) additional information on individual sites may be available, 2) newly discovered sites are continually reported and 3) all map locations are approximate. As a result, this report is intended to be the FIRST STEP in the process of identifying and evaluating possible environmental threats to specific properties and can only serve as a guide for conducting on-site visits or additional, more detailed toxic hazard research.

Toxics Targeting tries to ensure that the information in your report is presented accurately and with minimal alteration. The only systematic changes that are made correct obvious address errors in order to allow sites to be mapped. Any address changes that are made are noted in the map information section at the top of each corresponding Toxic Site Profile. Since the information presented in your report is not edited, please be aware that it can contain reporting errors or typographical mistakes made by the site owners/operators or government agencies that produced the information. Please be aware of some other limitations of your report:

- The computerized map used by Toxics Targeting is the same one used by the U.S. Census. While the map is generally accurate, no map is perfect. In addition, Toxics Targeting's mapping methods estimate where toxic site addresses are located if the address is not specifically designated on the Census map. FOR THESE REASONS, ALL MAP LOCATIONS OF ADDRESSES AND REPORTED TOXIC SITES SHOULD BE CONSIDERED APPROXIMATE AND SHOULD BE VERIFIED BY ON-SITE VISITS;

- UNDISCOVERED, UNREPORTED OR UNLOCATABLE TOXIC SITES MIGHT NOT BE IDENTIFIED BY THIS REPORT'S CHECK OF 15 TOXIC SITE CATEGORIES. TOXIC SITES REPORTED IN OTHER GOVERNMENT DATABASES MIGHT ALSO EXIST. FOR THESE REASONS, YOUR REPORT MIGHT NOT IDENTIFY ALL THE TOXIC SITES THAT EXIST IN THE AREA IT EXAMINES;

- The appendix of your report contains a listing of sites that could not be mapped due to incomplete or erroneous address information or other mapping problems. This listing includes unlocatable toxic sites in zip code areas within one mile of the target address as well as toxic sites without zip codes reported in the same county. IF YOU WOULD LIKE INFORMATION ON ANY OF THE LISTED SITES, PLEASE CONTACT TOXICS TARGETING.

- Some toxic sites identified in your report may be classified as known hazards. Most of the toxic sites identified in your report involve potential hazards related to the on-site use, manufacture, handling, storage, transport or disposal of toxic chemicals. Some of the toxic sites identified in your report may be the addresses of parties responsible for toxic sites located elsewhere. YOU SHOULD ONLY CONCLUDE THAT TOXIC HAZARDS ACTUALLY EXIST AT A SPECIFIC SITE WHEN GOVERNMENT AUTHORITIES MAKE THAT DETERMINATION OR WHEN THAT CONCLUSION IS FULLY DOCUMENTED BY THE FINDINGS OF AN APPROPRIATE SITE INVESTIGATION UNDERTAKEN BY LICENSED PROFESSIONALS;

- The information presented in your report is a summary of the information that Toxics Targeting obtains from government agencies on reported toxic sites. YOU MAY BE ABLE TO OBTAIN ADDITIONAL INFORMATION ABOUT REPORTED SITES WITH THE FREEDOM OF INFORMATION REQUEST FORM LETTERS THAT ARE PROVIDED ON THE INSIDE OF THE BACK COVER.

</table>
The potential health effects listed above are described in detail in the Toxic Site Profile section of this report. That section also provides some potential health effect summary information for selected individual chemicals. The source of that information is the National Institute of Occupational Safety and Health's Registry of Toxic Effects of Chemical Substances (RTECS). Some toxic sites, notably Hazardous Waste Facilities, only report chemical mixtures. RTECS only reports potential health effects for individual chemicals. Therefore, the absence of potential health effect information for a particular chemical reported at a site in this report does not necessarily mean that the site does not handle any chemicals that can pose potential health effects. Refer to individual Toxic Site Profiles to identify sites that handle chemical mixtures.
Toxics Targeting
1 Mile Radius Map
City Yard, Main St/Stephenson Blvd
New Rochelle, NY 10801

The toxic site categories that were searched to produce this map are listed below. The radius distance of the search is noted at the top of this map. Each identified site is marked with a symbol and a reference number. Please refer to the Toxic Site Profiles presented in the second section of your Computerized Environmental Report for more information on each site.

All map locations and distances are approximate.

Section Two: Toxic Site Profiles

The heading of each Toxic Site Profile refers to the site's map location and details:

- The facility name, address, city, state, and zip code (This information does not appear in the headings for Inactive Hazardous Waste Disposal Sites).
- Any changes that were made to a site's address in order to map its location.
- The site mapping method that was used (see How Sites are Located, at the end of this section for more information).

Toxic Site Profiles summarize information provided by site owners or operators and government agencies regarding various toxic chemical activities reported at each site, such as:

- Whether chemicals were stored, produced, transported, discharged or disposed of.
- The name of chemicals and their Chemical Abstract Series (CAS) numbers;
- The amount of chemicals and the units (gallons/pounds) the chemical was measured in.
- Whether the site or storage tanks at the site are currently active or inactive.
- Special codes used by government agencies to regulate hazardous waste activities at some sites (A complete description of the codes follows the profiles section).

For selected individual chemicals reported at various toxic sites, some potential health effect summary information appears below the site profile. Each potential health effect summary identifies chemicals by name and by Chemical Abstract Series (CAS) Number. An "x" under each potential health effect heading indicates positive toxicity testing results reported by the National Institute of Occupational Safety and Health's Registry of Toxic Effects of Chemical Substances (RTECS). Some chemicals (mostly appearing in profiles of Hazardous Waste facilities), are reported as mixtures, and RTECS health effect information is only available for individual chemicals. In addition, RTECS only provides information on approximately 100,000 common chemicals. Consequently, the absence of potential health effect summary information for a particular chemical identified in a Toxic Site Profile does not necessarily mean that the chemical does not pose potential health effects.

The Maximum Contaminant Level (MCL) in drinking water allowed for selected chemicals is also noted. In most cases, the only applicable MCL has been set by the New York State Department of Health (NYSDOH). Where NYSDOH has not set an MCL, the federal standard, if one exists, is listed and is marked by an asterisk.

Presented below are column headings that describe the health effect definitions used in RTECS and applicable New York State and federal drinking water standards. Reference sources for information presented in this section are also provided.

**ACUTE TOX:** Acute Toxicity: Short-term exposure to this chemical can cause lethal and non-lethal toxicity effects not included in the following four categories.

**TUMOR TOX:** Tumorigenic Toxicity: The chemical can cause an increase in the incidence of tumors.
MUTAG TOX: Mutagenic Toxicity: The chemical can cause genetic alterations that are passed from one generation to the next.

REPRO TOX: Reproductive toxicity: May signify one of the following effects: maternal effects, paternal effects, effects on fertility, effects on the embryo or fetus, specific developmental abnormalities, tumorigenic effects, or effects on the newborn (only positive reproductive effects data for mammalian species are referenced).

IRRIT TOX: Primary Irritant: The chemical can cause eye or skin irritation.

MCL: Drinking Water Standard - Maximum Contaminant Level (MCL) listed under Drinking Water Supplies, 10 NYCRR Part 5, Subparts 1.51(f),(g), and (h) for NYDOH MCL's and under the Safe Drinking Water Act, 40 CFR 141, Subparts B and G, (* indicates value for total trihalomethanes) for federal MCL's.

Reference Source for Toxicity Information: Registry of Toxic Effects of Chemical Substances (RTECS), NIOSH (on-line database); For further information, contact: NIOSH, 4676 Columbia Parkway, Cincinnati, OH, 45226, 800/35-NIOSH.

Inactive Hazardous Waste Disposal Site Classifications: 1 -- Causing or presenting an imminent danger of causing irreversible or irreparable damage to the public health or the environment -- immediate action required;

2 -- Significant threat to the public health or environment -- action required;

3 -- Does not present a significant threat to the environment or public health -- action may be deferred;

4 -- Site properly closed -- requires continued management;

5 -- Site properly closed, no evidence of present or potential adverse impact -- no further action required;

2a -- This temporary classification has been assigned to sites where there is inadequate data to assign them to the five classifications specified by law.

D1, 2, 3 -- Delisted Site (1: hazardous waste not found; 2: remediates; 3: consolidated site or site incorrectly listed)

NAME OF SITE:  Consolidated Edison - Echo Ave. Site
STREET ADDRESS:  Echo Avenue
TOWN/CITY:  New Rochelle
COUNTY:  Westchester
ZIP:  10801

SITE TYPE:  Open Dump-  Structure-X Lagoon-  Landfill-  Treatment Pond-
ESTIMATED SIZE:  3  Acres

SITE OWNER/OPERATOR INFORMATION:
CURRENT OWNER NAME:  Consolidated Edison Co. of NY
CURRENT OWNER ADDRESS:  4 Irving Place, New York, NY
OWNER(S) DURING USE:  Consolidated Edison Co. of NY
OPERATOR DURING USE:  Consolidated Edison Co. of NY
OPERATOR ADDRESS:  4 Irving Place, New York, NY

PERIOD ASSOCIATED WITH HAZARDOUS WASTE:  From  To 1981

SITE DESCRIPTION:
The site, approximately 150 feet x 600 feet in size, was originally owned by
Westchester Lighting Co. and was acquired by Consolidated Edison in the early
1930's. Con Ed operated an electrical distribution substation at this site
until 1981, when the substation was retired. The site is bounded by a fuel oil
dealer, a tidal creek, Echo Bay (Long Island Sound), and private residences.
The site includes substation buildings and a transformer yard. PCBs have been
found in soils and catch basin sediments, and on surfaces within structures.
Con Ed has completed initial clean-up. Subsequent sampling has shown PCB levels
as high as 50 ppm remaining.
A PRP Preliminary Site Assessment has been completed and cleanup is needed.

NATURE OF ACTION:

GEOTECHNICAL INFORMATION:

SOIL TYPE:

GROUNDWATER DEPTH:

ASSESSMENT OF ENVIRONMENTAL PROBLEMS:
On site soil and sediment contains PCBs. Echo Bay sediments contain as much as 0.2 ppm of PCB. Rear yards of private residences were found at approximately 1.1 ppm.

ASSESSMENT OF HEALTH PROBLEMS:
The site is immediately adjacent to residential and commercial property and extends to the Echo Bay tidal lands. PCBs have been found at high levels in the substation building and surrounding soil.

Considerable clean-up of PCBs has already been completed. Residential use for the property has been proposed, including use of the substation building. Residential use of the existing buildings, without remediation, could expose residents to long-term low levels of PCBs in the air. Exposure to contaminated site soils may also occur.

A supplemental off-site soil study is needed. Access is restricted by chainlink fencing. Area drinking water is primarily derived from upstate reservoirs. There are no known private or public drinking water wells in the vicinity. Potentially contaminated tideland sediments could expose wildlife, fish and residents to PCBs. Additional clean up will be required.

</table>
Hazardous waste codes presented in individual Toxic Information Profiles are defined below.

D001 Solid waste that exhibits the characteristic of ignitability, but is not listed under any other hazardous waste code.

D002 Solid waste that exhibits the characteristic of corrosivity, but is not listed under any other hazardous waste code.

D005 Barium

D008 Lead

D009 Mercury

F001 The following spent halogenated solvents used in degreasing: Tetrachloroethylene, trichloroethylene, methylene chloride, 1,1,1–trichloroethane, carbon tetrachloride, and chlorinated fluorocarbons; all spent solvent mixtures/blends used in degreasing containing, before use, a total of ten percent or more (by volume) of one or more of the above halogenated solvents or those solvents listed in F002, F004, and F005; and still bottom from the recovery of these spent solvents and spent solvent mixtures. (T)

F002 The following spent halogenated solvents: Tetrachloroethylene, methylene chloride, trichloroethylene, 1,1,1–trichloroethane, chlorobenzene, 1,1,2–trichloro–1,2,2–trifluoroethane, ortho–dichlorobenzene, trichlorofluoromethane, and 1,1,2–trichloroethane; all spent solvent mixtures/blends containing, before use, a total of ten percent or more (by volume) of one or more of the above halogenated solvents or those listed in F001, F004, or F005; and still bottom from the recovery of these spent solvents and spent solvent mixtures. (T)

F003 The following spent non–halogenated solvents: Xylene, acetone, ethyl acetate, ethyl benzene, ethyl ether, methyl isobutyl ketone, n–butyl alcohol, cyclohexanone, and methanol; all spent solvent mixtures/blends containing, before use, only the above spent non–halogenated solvents; and all spent solvent mixtures/blends containing, before use, one or more of the above non–halogenated solvents, and, a total of ten percent or more (by volume) of one or more of those solvents listed in F001, F002, F004, and F005; and still bottom from the recovery of these spent solvents and spent solvent mixtures. (I)

F005 The following spent non–halogenated solvents: Toluene, methyl ethyl ketone, carbon disulfide, isobutanol, pyridine, benzene, 2–ethoxyethanol, and 2–nitropropane; all spent solvent mixtures/blends containing, before use, a total of ten percent or more (by volume) of one or more of the above non–halogenated solvents or those solvents listed in F001, F002, or F004; and still bottom from the recovery of these spent solvents and spent solvent mixtures. (I,T)

U008 Acrylic acid (I)

U008 2–Propenoic acid (I)

U113 Ethyl acrylate (I)

U113 2–Propenoic acid, ethyl ester

U190 1,3–isobenzofurandione

U190 Phthalic anhydride

Source: U. S. Environmental Protection Agency
How Toxic Site Locations Are Mapped

Toxics Targeting maps site locations using addresses and map coordinates provided by site owners/operators or government agencies. Due to incomplete or inadequate address information, a small percentage of sites have not been located. In order to allow site locations to be verified independently, the information used to map each site is presented in the first section of each Toxic Site Profile, along with a description of the mapping technique used. The mapping process is explained below.

Map Identification Number: 12
Site Name: Acme World Manufacturing, Inc.
Site Address: 55 Main Street
Anytown, NY 11797

ADDRESS CHANGE INFORMATION
Revised Street: NO CHANGE
Revised zip code: NO CHANGE

1) Most toxic sites are mapped by matching addresses provided by site owners/operators or government agencies with locations on the U.S. Census map. These site locations are identified "address-matched."

Note: Some sites have an address match location and a map coordinate location. Both locations are mapped because they can be equally correct.

2) Some toxic sites are located using map coordinates provided by site owners/operators or government agencies. These site locations are identified "map coordinate." Map coordinates for Toxic Release Inventory sites and Major Oil Storage Facilities should be considered suspect.

3) Incomplete addresses or map coordinates require some site locations to be determined by commercial street maps (manual mapping), site visits, map coordinates from other databases and address location services. Application of any of these methods is identified accordingly.

4) Site addresses are sometimes corrected to eliminate obvious errors that prevent sites from being mapped. All address corrections are noted here.

5) Some sites have more than one map location. If there is agreement between map locations, these locations can be assumed to be more valid than if there is no agreement. A "yes" means that a site has multiple map locations closer than 500 meters apart. A "no" means that either: a) the site has only one map location or b) the site has multiple map locations more than 500 meters apart.

MAP LOCATION INFORMATION
Site location mapped by:
Address Matching
or Map Coordinate
or Manual Mapping
or Site Visit
or Other Database
or Commercial Vendor

Multiple map locations within 500 meters of each other: YES OR NO
Toxics Targeting's Computerized Environmental Report contains government information compiled from 13 categories of reported known or potential toxic sites. Each toxic site category is summarized below, usually with descriptions obtained from the government agency that collected the information. The date that Toxics Targeting obtained the information is noted. Additional information on individual sites identified in this report can be obtained by contacting the appropriate agency and referencing the permit numbers and identification numbers presented in each Toxic Site Profile.

"Hazardous Waste Site Remediation means removal, treatment or containment of hazardous wastes so they cannot harm human health or the environment. The Inactive Hazardous Waste Site Remediation Program covers the remedial life of a site, from listing in the registry, investigation, classification, enforcement, construction, to closure and monitoring. Technical work includes collecting and analyzing soil, air and water samples, identifying contaminants, determining violations of environmental standards, and identifying the responsible parties. The site's location is listed in the Registry of Inactive Hazardous Waste Sites. Registry data includes site name, description, classification, cleanup status, types of cleanup, owner information, types and quantities of contaminants, and assessment of health problems." DEC Geographic Data Source Dictionary.

"Landfill" means a disposal facility or part of one at which solid waste, or its residue after treatment, is intentionally placed in or on land, and at which solid waste will remain after closure and which is not a landspreading facility, a surface impoundment, or an injection well."

"Recyclables handling and recovery facility" means a Solid Waste Management Facility, other than collection and transfer vehicles, at which recyclables are separated from the solid waste stream, or at which previously separated recyclables are collected."

"Incinerator" means an enclosed device using controlled flame combustion used to thermally break down solid waste including refuse-derived fuel, to an ash residue that contains little or no combustible materials."

"Transfer station" means a solid waste management facility, other than a recyclables handling and recovery facility exclusively handling non-putrescible recyclables, that can have a combination of structures, machinery, or devices where solid waste is taken from collection vehicles and placed in other transportation units for movement to another solid waste facility." DEC Geographic Data Source Dictionary.

5) Major Oil Storage Facilities, source: New York State Department of Environmental Conservation. Information obtained: 6/94 "Facilities are licensed pursuant to Article 12 of the Navigation Law, 6NYCRR Parts 610 and 17NYCRR Part 30. These facilities may be onshore facilities or vessels, with petroleum storage capacities equal to or greater than four hundred thousand gallons." DEC Geographic Data Source Dictionary.

8) Toxic Release Inventory, source: New York State Department of Environmental Conservation (DEC)/U. S. Environmental Protection Agency. Information obtained: 4/93

"Under Section 313 of the Emergency Planning and Community Right-to-Know Act, certain manufacturing facilities are required to report releases to the air, water, and land of any specifically listed toxic chemical. The release information for each chemical is reported on a Toxic Chemical Release Inventory Reporting form (U. S. Environmental Protection Agency Form R). " "The EPA Form R is a five-page form reporting: 1) facility identification data; 2) off-site locations to which toxic chemicals in waste are transferred; 3) chemical specific information including annual releases of chemicals to the environment; 4) amount of transfers of the chemical in waste to off-site locations, waste treatment methods and efficiency, and optional information on waste minimization; 5) supplemental information. A Form R must be completed for each chemical that exceeds the annual reporting threshold, regardless of the amount released; even zero releases must be reported." DEC Geographic Data Source Dictionary.

9) Air Discharge Facilities, source: New York State Department of Environmental Conservation. Information obtained: 1992. This database contains address information on each facility and the type of air emission source it is. The information is obtained from the Regulatory Compliance Information System.

10) Toxic Wastewater Discharges (Permit Compliance System), source: New York State Department of Environmental Conservation/U. S. Environmental Protection Agency. Data obtained: 2/92

"Discharges of wastewater to New York State's waters, both surface and ground, are required by the Environmental Conservation Law to have State Pollutant Discharge Elimination System (SPDES) permits. These permits establish numerical limits for various polluting substances. Limits based on a determination of the substances' potential impacts on the State's surface and ground waters. Additionally, the SPDES permits contain substance monitoring (sampling and analysis) requirements including frequency for reporting the monitoring data to the State and, in some cases, the U. S. Environmental Protection Agency. This monitoring frequency is a regulatory requirement and is performed by the permittee. Independent checks of the permittee discharges and self-monitoring are performed by the DEC." DEC, Geographic Data Source Dictionary.

"Data collected as required by New York State in 6NYCRR Part 596 covering substances listed in 6NYCRR Part 597. These facilities store regulated substances in aboveground tanks with capacities greater than 185 gallons and /or in underground tanks of any size." DEC Geographic Data Source Dictionary.

12) Petroleum Bulk Storage Facilities, source: New York State Department of Environmental Conservation. Information obtained: 1/94. This database generally contains information on aboveground and underground petroleum storage facilities with a combined storage capacity over 1,100 gallons.

This database contains information collected on spills reported to the NYSDEC as required by one or more of the following: Article 12 of the Navigation Law, 6 NYCRR Section 613.8 (from Petroleum Bulk Storage Regulations) or 6 NYCRR Section 595.2 (from Chemical Bulk Storage Regulations). This information is also provided to the USEPA's Emergency Response Notification System (ERNS). The database includes active (unremediated) and inactive (remediated), stationary source (see below) and non-stationary source (see below) spills reported between April 1, 1986 and December, 1993.

Active spills: Following conditions both met: 1) spill not cleaned up; 2) paperwork not completed.
Inactive spills: Following conditions both met: 1) spill cleaned up; 2) paperwork completed.

Stationary Sources: 1) Commercial facility -- No petroleum for sale; 2) Non-commercial Facility -- Institution;
3) Major Oil Facility; 4) Bulk Oil Facility -- Distributor or Wholesale; 5) Gas Station; 6) Self-Spiller (Residential); and 7) Unknown.
Non-Stationary Sources: 1) Passenger Vehicle; 2) Tractor Trailer Truck (Commercial Vehicle); 3) Tank Truck;
4) Vessel (boat, barge, pleasure craft); and 5) Railroad Car.

APPENDIX 9.2

REGULATORY DOCUMENTATION AND CORRESPONDENCE
November 8, 1994

Ms. Mary Landrigan  
Freedom of Information Officer  
Westchester County Department of Health  
19 Bradhurst Avenue  
Hawthorne, NY 10532

RE: Freedom of Information Act Request  
City of New Rochelle Maintenance Yard  
Main Street & Stephenson Boulevard  
New Rochelle, New York

Dear Ms. Landrigan:

Kaselaan & D'Angelo has been retained to perform a Phase I Environmental Site Assessment for the above-referenced property.

In order to complete our assignment, we would like to review (or have copies of) your records relating to permits and violations relating to the handling or storage of hazardous materials by past or present operators on this property.

Please contact me at (212) 216-7091 with regard to whether or not you have any files, and if so, when I might be able to schedule an appointment to review them.

Thank you for your attention to this matter.

Sincerely,

Phillip J. Fallon, Jr.  
Project Manager
Re: Freedom of Information Request No. 9557
City of New Rochelle
Maintenance Yard

Dear Mr. Fallon:

This is to acknowledge the receipt of your Freedom of Information request dated Nov 4, 94, which was received in this office on Nov 9, 94.

Your request has been forwarded to the appropriate staff for response; it is anticipated that you will have a response to your request by Nov 30, 94.

In any further communication with us, please refer to your request by the Request Number indicated above. Thank you.

Sincerely,

Valerie Goldstein
Freedom of Information Officer

VP/G/1am

As an authorized representative of the above named facility, I affirm under penalty of perjury that the information displayed on this form is correct to the best of my knowledge. Additionally, I recognize that I am responsible for ensuring that this facility is in compliance with all sections of 6 NYCRR Parts 612, 613 and 614, not just those cited below:

- The facility must be registered and re-registered if there is a transfer of ownership.
- The Department must be notified within 30 days prior to adding, replacing, reconditioning, or permanently closing a stationary tank.
- The facility must be operated in accordance with the code for storing petroleum, 6 NYCRR Part 613.
- Any new facility or substantially modified facility must comply with the code for new and substantially modified facilities, 6 NYCRR Part 614.
- This certificate must be posted on the premises at all times. Posting must be at the tank, at the entrance of the facility, or the main office where the storage tanks are located.
- Any person with knowledge of a spill, leak or discharge must report the incident to DEC within two hours (1-800-487-7382).

APPENDIX 9.3

PRELIMINARY ASBESTOS SURVEY
9.3 Preliminary Asbestos Survey

A survey of potential asbestos-containing materials (ACM) was made during the Phase I site reconnaissance. Some of these materials were sampled to confirm their identification as ACM.

This survey was not intended to yield a thorough inventory of ACM, but rather to provide some detail with which a ballpark estimate can be made of the quantity of ACM.

The table on the following page lists, by area the types of suspected ACM and approximate quantities.

Those marked with an asterisk above have been sampled. Laboratory analysis results is pending.

Some ACM materials may exist above ceiling files, such as in the upstairs area of the Repair Garage, or Underground, such as covering pipes leading to the Carpentry Shop, or in areas not inspected.

It is felt that the list in the table is representative, however.

4.3.2 Historical Site Plans

A selection of site plans supplied by the City Department of Public Works were reviewed for information pertaining to structures and possible use of the site.

- File 05-151 Drawing 07 "Plan for City Yard", dated 6/9/16: shows outlet sewer and sand catcher in the sewer easement; 10 bins, engine room, 7 garage bays, 3 stables, steam rollers shed, and repair shop. The "bins" were located along a dock on the Echo Bay edge of the property. It is not known if the structures in this plan were ever built, however various buildings were constructed in 1917 (see Section 4.3.3 below).

- File 05-151 Drawing 09, untitled, date not clear: shows buildings as depicted in the 1931 Sanborn. A gasoline tank is indicated underneath the canopy in front of the "Storage Oil Tanks Boiler Room", which is now the Sewers & Drains sitting room/office.

- File 05-151 Drawing 10 "Plan of Existing City Yard", last updated 2/14/58: in addition to the structures shown on the 1951 Sanborn, this drawing shows the Bookmobile Garage (added 2/14/58), a steel building in the central yard (added 1951), storage bins along the eastern boundary for cinders and bluestone, and stock piles of cinder and bluestone and sand. Of additional significance, the present Sewers & Drains sitting room is labeled "Oil Tanks & Boiler Room".

- File 09-151 Drawing 06 "Alteration of Compost Building", date not clear: this drawing shows design for the conversion of the Compost Building to a paint shop. It also shows a dry well which might have been for boiler room (located in the basement) water.

- File 12-151 Drawing 01 "Topo Layout City Yard", dated 12/1/47: shows a transformer area off the southwest corner of the Compost Building.
4.3.3 Bureau of Buildings

Following are the projects and finish dates (and plan number) on file at the Bureau of Buildings:

<table>
<thead>
<tr>
<th>Finished</th>
<th>Plan No.</th>
<th>Project</th>
</tr>
</thead>
<tbody>
<tr>
<td>1917</td>
<td>None</td>
<td>Various buildings</td>
</tr>
<tr>
<td>11/4/26</td>
<td>10111</td>
<td>Grading &amp; Alterations</td>
</tr>
<tr>
<td>1/26/37</td>
<td>17082</td>
<td>Comm. Gr. ??</td>
</tr>
<tr>
<td>7/16/51</td>
<td>24409</td>
<td>Stone steel storage shed</td>
</tr>
<tr>
<td>6/30/49</td>
<td>23340</td>
<td>Alterations &amp; Additions</td>
</tr>
<tr>
<td>4/28/53</td>
<td>25622</td>
<td>Addition</td>
</tr>
<tr>
<td>9/22/72</td>
<td>36006</td>
<td>Erect a Municipal Repair Garage</td>
</tr>
<tr>
<td>6/14/73</td>
<td>29356</td>
<td>Storage Garage</td>
</tr>
</tbody>
</table>

From these records it is not clear when all of the present structures were built. In summary the historical information presented indicate the following:

- Carpentry Shop (one story brick and wood); possibly in 1917, but sometime before 1931;
- Sewers & Drains, Streets & Highways, and Sanitation (long, segmented L-shaped building); same as Carpentry Shop;
- Sewage Disposal Plant: same as Carpentry Shop;
- Compost Building: same as Carpentry Shop;
- Machinery/Car Storage: 1951;
- Repair Garage: 1972; and

4.3.4 Polk Directories

Several early directories published between 1917 and 1930 were reviewed for information about historical use not clearly documented in materials presented above:

- 1917: 222-234 Main is listed as John Hettinger, Commissioner of Streets;
- 1920: Hadert, Commissioner of Streets;
• 1924: 222-230 Main is listed as DPW Bureau of Streets; and

• 1930: 222-224 Main is listed as Bureau of Streets.

This information clearly indicate the site as in use by the City DPW as early as 1917.

4.4 Local Agency Records Sources

4.4.1 Westchester County Department of Health
A Freedom of Information Letter (FOIL) was sent to the Westchester County Department of Health for information regarding hazardous materials permits, and violations. An acknowledgement was received on 11/9/94 (see copies of correspondence in Appendix 9.2). Information received from the Department of Health will be provided in an addendum to this report.

4.4.2 New York State Department of Environmental Conservation, Region 3
A FOIL was sent regarding underground storage tanks and spills on this property. No response has been received to date (see copy of FOIL in Appendix 9.2). Information received from NYSDEC will be provided in an addendum to this report.
5.0 INFORMATION FROM SITE RECONNAISSANCE AND INTERVIEWS

5.1 Hazardous Substances in Connection with Identified Uses
(Including Storage, Handling, and Disposal)

Hazardous substances are used/generated in conjunction with the uses, and operation and maintenance of the facility. Bulk quantities of some of these materials are stored on-site. The types and approximate quantities observed at the time of the site reconnaissance were as follows:

- Carpentry Shop:

  Numerous gallon, quart, pint and spray cans of thinners, paints, stains, glues, are scattered throughout the shop.

- Sewers & Drains, Streets & Highways, and Sanitation (long, segmented L-shaped building): This building has a number of different functional areas:

<table>
<thead>
<tr>
<th>Chemical</th>
<th>Quantity</th>
</tr>
</thead>
<tbody>
<tr>
<td>Streets &amp; Highways Office: none observed;</td>
<td></td>
</tr>
<tr>
<td>Basement boiler room: none observed;</td>
<td></td>
</tr>
<tr>
<td>Back locker room: none observed;</td>
<td></td>
</tr>
<tr>
<td>Central Stock Room: none observed;</td>
<td></td>
</tr>
<tr>
<td>&quot;OSHA Shed&quot; hazardous materials storage:</td>
<td></td>
</tr>
<tr>
<td>Paint</td>
<td>15 x 1 gal.</td>
</tr>
<tr>
<td>Formula 190 Weed Killer</td>
<td>2 x 55 gal.</td>
</tr>
<tr>
<td>Alcohol</td>
<td>13 x 1 gal.</td>
</tr>
<tr>
<td>D-Stroy (caustic cleaner)</td>
<td>1 x 30 gal.</td>
</tr>
<tr>
<td>Formula 162 Degreaser</td>
<td>1 x 30 gal.</td>
</tr>
<tr>
<td>Formula 26 MX-10 Insecticide</td>
<td>1 x 30 gal.</td>
</tr>
<tr>
<td>Pine Cleaner</td>
<td>1 x 30 gal.</td>
</tr>
</tbody>
</table>

According to Mr. McKnight, the weed killer is no longer used (a special license is needed), and they have to dispose of the existing stock.
Chemical

- Broom Shed: none observed;
- Sanitation Office: none observed;
- Sewers & Drains Sitting Room: none observed;
- Parking Garage:

  Fuel oil 1 x 55 gal.

- Equipment Garage:

  Disinfectant 2 x 55 gal.

- Locker Room/Kitchen/Bathroom: none observed.

- Compost Building: not inspected;
- Machinery/Car Storage: none observed;
- Repair Garage: has a number of different functional areas:

  - Bay area:

    Hydraulic oil 1 x 55 gal.
    Transmission fluid 1 x 55 gal.
    Chassie grease 1 x 55 gal.
    Washing soap 1 x 55 gal.
    Gear Lube 75W-90 2 x 120 lb.
    Voltz ESS-90 Solvent in sinks 3 x 15 gal.
    Volts ESS-90 Solvent 1 x 30 gal.
    Hydraulic lift reservoirs 3 x 50 gal.

The parts washing sink solvent is an aliphatic hydrocarbon/limonene blend (CAS # 64742-47-8 and 5989-27-5). Approximately 45 gallons of this material are used annually. It is disposed in the waste oil tank.

The other chemicals are disposed through normal use.
Waste oil is stored in an underground 2,000 gallon tank. Pickups occur approximately every couple of months. A receipt for the pickup of 600 gallons on 11/3/94 was examined.

- Welding Room:
  
  Oxygen bottles  
  Propane bottles  
  Acetylene bottles  
  
  8 x 75 lbs.  
  12 x 100 lbs.  
  8 various sizes

- Garage (northeast corner of building):
  
  Lubricants (grease & heavy oils)  
  Hydraulic fluid  
  Transmission fluid  
  Antifreeze  
  Gasoline additive (xylene/ethylbenzene)  
  Diesel additive  
  
  13 x 120 lbs.  
  3 x 55 gal.  
  4 x 55 gal.  
  3 x 55 gal.  
  1 x 30 gal.  
  1 x 30 gal.

- Battery Room:
  
  Batteries  
  
  40 - 50 various sizes

In addition a number of spray cans of lubricants and other repair aids were observed in maintenance areas but not inventoried.

- Bookmobile Storage Building: none observed.

5.2 Hazardous Substances Containers and Unidentified Substance Containers (Including Storage, Handling, and Disposal)

No unidentified substance containers were found.

5.3 Storage Tanks (Including Contents and Assessment of Leakage or Potential for Leakage) and Generators

The property potentially has 13 storage tanks:
<table>
<thead>
<tr>
<th>Size</th>

</tbody>
</table>

Most of the information above was extracted from the Petroleum Bulk Storage Application (not dated), but which matches the City’s Petroleum Bulk Storage Registration Certificate, dated 4/2/93. The last two tanks listed above are not on the certificate.

The presence of the last tank listed in the table above is not certain, since only a vent was observed during the site reconnaissance.

All tanks are required to be tightness tested. No documentation regarding tightness testing was available for examination.

According to the Fire Department’s records, a 3,000 gallon underground number 2 fuel oil tank was installed 12/14/61 to supply the burner in the Compost Building. This tank was not found during the site reconnaissance, and may be a 14th tank.
According to the Fire Department's records, the 2,000-gallon fuel oil tank in front of Sewers & Drains Repair Garage was installed 12/14/61 and relined 7/9/80.

A gasoline tank was located where the Sanitation Office is presently, as evidenced by an old site plan (File 05-151, Drawing 09). This tank may have been removed.

5.4 Indications of PCBs (Including How Contained and Assessment of Leakage or Potential for Leakage)
A transformer is located near the northwest corner of the Repair Garage. No oil staining was observed on the pad around the base of the transformer.

A letter requesting information regarding the PCB content of this transformer was sent to Con Edison. A copy of the letter appears in Appendix 9.2.

An old site plan dated 12/1/47 (File 05-151, Drawing 01) indicates that transformers were once located near the southwest corner of the Compost Building.

5.5 Indications of Solid Waste Disposal
No evidence of the presence of dumping of solid waste was seen during the inspection of the property.
6.0 FINDINGS AND CONCLUSIONS

We have performed a Phase I Environmental Site Assessment in conformance with the scope and limitations of ASTM Practice E 1527 of 229 Main Street (City Yard), New Rochelle, New York, the property. Any exceptions to, or deletions from, this practice are described in Section 2.2 of this report. This assessment has revealed no evidence of recognized environmental conditions in connection with the property, except for the following:

- Lack of tank tightness test data leaves the integrity of nine USTs in question. Reportedly, two of the 1,000 gallon lube oil tanks are no longer used due to infiltration of either surface water or groundwater into the tanks;

- The vaulted 550-gallon tank in the Streets & Highways’ office basement appears to be leaking;

- The possible presence of three abandoned tanks: a gasoline tank under the Sanitation office; a 3,000 gallon tank by the Compost Building; and a tank in connection with the vent behind the Sewers and Drains’ Parking Garage;

- The soils in the vicinity of the former aboveground kerosene tank may have accumulated kerosene;

- The soils in the vicinity of the vehicle wash area may be laden with hydrocarbons and cleaning chemicals from long use;

- The soils in the vicinity of the outside drum storage areas may have accumulated hazardous materials;

- The soils on the periphery of the property may have accumulated hazardous materials by washing down from the yard surface (this area is the property’s topographically lowest area);

- The soils near the former transformers may have accumulated PCBs;
- The soils and dry well in the vicinity of the Compost Building which was once a paint shop and may have accumulated solvents; and

- The soils in the vicinity of the salt storage bins may have accumulated high chloride concentrations.

Some regulatory records review (Westchester Department of Health and New York State Department of Environmental Conservation, Region 3) is pending. A report of our review of these files will either be included in a final draft of this report, or issued as an addendum.
7.0 SIGNATURES OF ENVIRONMENTAL PROFESSIONALS

Site Name: City Yard

Site Address: 229 Main Street (City Yard) New Rochelle, New York

Client: The Department of Development, City of New Rochelle

Location: 515 North Avenue, New Rochelle, New York

Issue Date: November 14, 1994

The following professionals worked on this environmental site assessment:

Phillip J. Fallon, Jr.

Signature
Investigator/Project Manager

A copy of the resume of the person identified above follows.
Education:  
Master of Science, Adelphi University, 1985  
Bachelor of Science, S.U.N.Y. at Stony Brook, 1969

Highlights of Experience:

Mr. Fallon has over 20 years of experience in environmental consulting and has been involved in a wide range of studies, including environmental site assessments, environmental impact assessments (including 316a and b demonstrations, New York City CEQR applications), ecological survey programs, wetlands delineation, and hazardous waste site remediations.

- Currently manages the Company’s environmental site assessments program including the development of guidelines and quality assurance program for site assessment activities.

- Designed and wrote the RI/FS ecological assessment work plan for Pennsylvania and Fountain Avenue landfills for the New York City DEP.

- As Manager of Hazardous Materials Site Assessments (1987 - 1990), he developed an environmental site assessment program which performed over 700 site investigations and performed approximately 200 environmental site assessments himself.

- Scientist, zoological survey of 415-acre Staten Island Industrial Park (East Side Project) for an EIS, 1982 and 1985.

- Scientist, benthic invertebrate survey of the aquatic environs of David’s Island, 1984.
Fourteen active spills listed in the database are located within one-half mile of the subject property:

</table>

None of these spills are a likely source of contamination to the subject property. They are either cross gradient (symbol number 32 in Figure 4.1b), too distant (symbol numbers 41, 45, 36, and 37) or downgradient (the remaining ones).
In addition to these 14 active spills, two inactive, or remediated spills have been identified as having occurred on the subject property:

- (Unknown quantity) gasoline spill on 6/13/91; and
- 50 gallon gasoline spill on 9/17/92.

4.1.5 New York State Registered Storage Tanks
The New York Department of Environmental Conservation, Petroleum Bulk Storage program maintains an inventory of all registered facilities that have petroleum storage capacities in excess of 1,100 gallons, and less than 400,000 gallons.

The subject property is listed as having 10 active and one closed tank. These are described in Section 5.3 below.

4.2 Physical Setting Source
A USGS 7.5 Minute Topographic Map showing the area on which the property is located was reviewed (See Figure 4.2). This source provides information about geologic, hydrogeologic and topographic characteristics of the site. Local topography slopes to the southeast toward Echo Bay, from an elevation of approximately 25 feet above mean sea level (MSL) at the western edge of the property to approximately 10 feet above MSL along Echo Bay. A bedrock outcrop is present at the northwesterly corner of the site, indicating that depth to bedrock (and hence groundwater) over the remainder of the site is relatively shallow.

Site soils are classified by the USDA Soil Survey of Westchester County as Urban Land. These soils are highly disturbed and reworked, consisting primarily of silty, sandy, and gravelly fill materials commonly found in urban and other highly developed areas. Native soil profiles, for the most part, can no longer be determined. Compaction and drainage characteristics are highly variable and depend on the types of fill materials present at each site.

4.3 Historical Use Information
Historical use of the property was investigated by a review of the available Sanborn fire insurance atlases, Bromley Atlas of 1911, and the Beers Atlas of 1867. These atlases provide fairly detailed information regarding the structures on the site back to the turn of the century, in this case since 1867.
The records of the Bureau of Buildings, and various historical site plans provided by the City Department of Public Works were reviewed for more detailed information concerning the structures (and use) of the property.

Finally, the Polk Directories, a reverse telephone directory, were reviewed for addressee names for years in between Sanborn atlas updates of 1911 and 1931.

The information from these four sources regarding historical use is summarized in the Sections 4.3.1 through 4.3.4 below.
4.3.1 Historical Atlases

Six different historical atlas plates, spanning over 120 years (1867, 1911, 1931, 1951, and 1990) were examined for historical land use information. Following is a brief summary of the review of the atlases, copies of which appear in Figures 4.3a through 4.3f:

- 1867 Beers: Residence of William Andrews, and "Brooklyn City Ice Company Ice House". Ice from Crystal Lake (just on the other side of Main Street, then Boston Turnpike) may have been cut and stored here, packed in salt hay;

- 1911 Bromley: vacant, except for a small boathouse. A sewer easement is a prominent part of the property;

- 1911 Sanborn: same as the 1911 Bromley, except that two 2-story dwellings are also shown;

- 1931 Sanborn: labeled "Department of Public Works" with four new masonry structures shown. These structures are labeled as follows:
  
  "Office" (Bureau of Streets)  
  "Storage"  
  "Tools"  
  "Auto" "Trucks"  
  "Street Cleaning Machinery"  
  "Compost Building"  
  "Sewage Disposal Plant"

- 1951 Sanborn: a new structure, the "Municipal Garage" is shown, and modifications to the buildings shown in the 1931 Sanborn. The buildings have the following new labels:
  
  "Auto Repair"  
  "Police Garage"

The "Police Garage" replaced the "Street Cleaning Machinery" section. Both residential dwellings were removed by this time;

- 1990 Sanborn: two new structures appear, the Bookmobile Storage Building and the Repair Garage. Some modification of the original buildings has also occurred.

INTRODUCTION

HydroEnvironmental Solutions, Inc. (HES) was retained by the City of New Rochelle (CNR) to complete a subsurface investigation at the City Garage facility located at the intersection of Post Road and Stephenson Drive, in New Rochelle, New York (Figure 1). This work was undertaken in response to New York State Department of Environmental Conservation (NYSDEC) Spill No. 98-03810. The investigation included drilling seven onsite test borings, installation of monitor wells at the test boring locations, collection of soil and groundwater samples for laboratory analysis, and permeability testing at each monitor well. The purpose of this investigation was to delineate the extent of petroleum hydrocarbon impacted soil and groundwater related to the operation of a municipal garage and refueling facility at the subject site.

FIELD ACTIVITIES

Test Boring Drilling and Soil Sampling

On July 16, 17, 18, and 19, 2002, HES personnel provided environmental oversight on behalf of the City of New Rochelle during drilling of test borings and installation of groundwater monitoring wells at the City Yard. Drilling of test borings and monitor well installation was completed by Aquifer Drilling & Testing, Inc. (ADT), of Troy, New York. Test borings were completed to depths of 10.3 to 20 feet below grade (ftbg). All test borings encountered fill comprised mainly of gravel in a sandy, silty matrix. Groundwater was encountered at 7-10 ftbg in the test borings.

HES personnel collected soil samples using a 2-inch split spoon sampler, and collected grab samples from drill cuttings. The split spoon sampler was driven by a 140-pound hammer over a 4-foot stroke. The onsite hydrogeologist field-screened soil samples for the presence of volatile organic compound VOC vapors using a photoionization detector according to the headspace method. Samples from the interval yielding the highest PID reading, or at the water table, in accordance with industry-accepted protocol, were placed on ice in a cooler and sent to York Analytical Laboratories, Inc. (York), a New York State certified laboratory located in Stamford, Connecticut, where they were analyzed for the presence of VOCs using EPA Method 8021 modified to include methyl tertiary butyl ether (MTBE). Soil samples collected from TB-4, TB-6, and TB-7 were further analyzed for semi-VOCs (SVOCs) according to EPA method 8270 (STARS list) due to the presence of black petroleum hydrocarbon
stained organic matter observed in the soils at these locations. The geologic logs for each test boring, including the results of PID field screening, are included in Appendix 1. The results of laboratory analysis of soil samples collected during test boring are included as Table 1, and the raw data is included in Appendix 2. The locations of test borings are shown on Figure 2.

Monitor Well Installation and Development

Monitor wells MW-1, MW-2, MW-3, MW-4, MW-5, and MW-6 were installed at the corresponding test boring locations. No monitor well was set in TB-7, due to the shallow depth of refusal. Monitor wells were installed to completion depths ranging from 10 to 20 ftbg. The wells were constructed of 4-inch diameter 10-slot schedule 40 PVC well screen and 4-inch diameter schedule 40 PVC solid riser pipe. The annular space around each well was backfilled with No. 1 sand to two feet above the well screen, sealed with two feet of bentonite pellets, and backfilled to 0.5 ftbg with (PID screened) clean drill cuttings. Each wellhead was encased in a water tight protective manhole set flush with grade and secured and sealed with a watertight locking well cap. Monitor well construction details are included on the geologic logs attached in Appendix 1, and monitor well locations are shown on Figure 3. Following completion of the well construction, HES personnel developed each well by evacuating the well column with a peristaltic pump and disposable polyethylene tubing. The pump used maintains a maximum rate of three gallons per minute, and was run at the maximum rate to initially dewater the well, and then slowed to maintain a pumping rate consistent with well recovery. To further develop the monitor wells, during well evacuation with disposable polyethylene bailers prior to groundwater sampling (described below), HES personnel surged the well with the polyethylene bailers to further reduce the fine sediment fraction contained in each monitor well annulus.

Monitor Well Survey

HES completed a survey of the top-of-casing (TOC) elevations of the newly installed monitor wells on August 1, 2002. These elevations are referenced to a previously completed topographic survey provided by the City on the site map. The east corner of the garage building sidewalk is assigned an elevation of 18 feet above sea level, as shown on the City site map. The TOC elevations are given on Table 2.
Permeability Testing

On August 1, 2002, HES completed a permeability test at each monitor well using the slug test method of Bouwer and Rice (1976). The method employed involves the removal of a “slug” of water (via disposable polyethylene bailer), and recording the rate of water level rise as the water level in the monitor well returns to the static level. HES measured the static water level in each monitor well, gently inserted a disposable polyethylene bailer, and monitored the water level until it returned to the measured static depth. After this was achieved, the bailer was quickly removed, and the water level monitored in second-scale intervals until the static water level was regained.

Due to the proximity of the well field to the Long Island Sound and its tidal influence, the monitor wells onsite are subject to varying degrees of tidal influence. Therefore, a secondary trend of water level versus time was documented in several monitor wells. As a result of tidal influence, static water level was not regained in several wells, as the permeability testing was conducted during an ebb tidal period.

The results of permeability testing according to the Bouwer and Rice (1976) slug test method are summarized below, and the field data is attached as Appendix 4.

Groundwater Monitoring and Sampling

On August 1, 2002, HES measured the water level in the six newly installed wells using a sonic interface tape. The depth to water level measurements were referenced to the surveyed TOC elevation at each well, and the calculated ground water elevations are given on Table 2. Groundwater samples collected from each monitor well (excluding MW-2) were analyzed for field parameters including pH, temperature, and conductivity. Groundwater monitoring data as collected in the field are included in Appendix 3. Free-phase hydrocarbon was detected in one well, MW-2, at a thickness of 0.01 feet. The depth to groundwater data were converted to groundwater elevations, and contour maps were created from these data. The groundwater elevation contour map is shown on Figure 4.

Five of the six onsite monitor wells were sampled on August 1, 2002. Monitor well MW-2 was not sampled due to the presence of free-phase hydrocarbon in the well. Prior to sampling, HES evacuated at least three times the volume of standing water in each well using disposable polyethylene bailers. The samples were placed on ice in a cooler, and transported under controlled conditions to York. The samples were analyzed for VOCs according to EPA Method 8021 modified to include MTBE (EPA
Method 8021 replaces the outdated EPA Method 8020, and analyzes for both aromatic and halogenated VOC). The groundwater evacuated from the monitor wells was decanted into drums for temporary onsite staging prior to disposal.

Due to the variable nature of groundwater elevations beneath the site, influenced by the nearby Long Island Sound, HES measured the depths to water in the six monitor wells on a later date (August 9, 2002). During this monitoring round, 1.42 feet of free-phase hydrocarbon was detected in monitor well MW-2. Depth to water ranged from 5.83 ftbg (MW-4) to 11.12 ftbg (MW-2) (Figure 5).

RESULTS OF INVESTIGATION

Soil Quality

PID field screening determined that significant VOC vapors were present in all but one test boring (TB-5) (0.0 calibration gas equivalents, or parts per million (ppm)). Results of PID field screening are included on the geologic logs (Appendix 1).

Laboratory analytical results of soil samples demonstrate that significant adsorbed VOC concentrations (total adsorbed BTEX concentrations > 100,000 ppb) are present in test borings TB-1, TB-2, and TB-3. Lesser concentrations of adsorbed VOCs were detected in samples from TB-6. Trace concentrations of adsorbed xylenes were detected in the sample from test boring TB-7, and no adsorbed VOCs were detected in samples from test borings TB-4 and TB-5. The detected concentrations of total lead in the soil samples from each boring range from a low of 0.5 parts per million (ppm) to 310 ppm. The results of laboratory analysis according to EPA Method 8270 (analysis for SVOCs) reveal that SVOC concentrations at sampling points TB-4, TB-6 and TB-7 are below the NYSDEC Recommended Cleanup Objectives (TAGM 4046). The results of soil sample laboratory analysis are summarized on Table 2, and shown on Figures 2 and 7. Figure 7 includes geologic cross sections through the site. Copies of the raw laboratory data for analysis of soil samples are included in Appendix 2.

Water Quality

The results of laboratory analysis demonstrate that dissolved VOCs were present in groundwater samples collected from the five monitor wells sampled (monitor well MW-2 was not sampled due to the presence of free-phase hydrocarbon). Dissolved BTEX was detected at each of the five monitor wells, in cumulative concentrations ranging from 7,450 μg/L (micrograms per liter, or ppb) in samples from MW-1 to 2 μg/L
in samples from both MW-4 and MW-5. (The BTEX compounds: benzene, toluene, ethylbenzene and total xylenes, are the most frequently encountered aromatic hydrocarbon compounds in gasoline, and are subsequently used as indicators.)

Dissolved MTBE was detected in samples from four of the five monitor wells sampled. Detected concentrations range from 1,300 µg/L in samples collected from MW-3 to 28 µg/L in samples collected from MW-4. Dissolved MTBE was not detected in groundwater samples from monitor well MW-6.

The results of laboratory analysis of groundwater samples are summarized on Table 3, and shown on Figure 3. The raw laboratory data is attached as Appendix 5.

**Hydrogeologic Setting**

The subject site is immediately underlain by approximately 10 feet of fill. Fill consists of a variety of materials, including pebble and cobble gravel, generally in a sandy matrix. Wood fragments were noted in drill cuttings during drilling activities.

Native lithologies underlying the fill are comprised of laminated fine sand and black organic-rich mud (estuarine sediments), rather than glacial till, as mapped by Caldwell et al. (1989). Thickness of these sediments varies, and they overly the crystalline bedrock.

Bedrock underlying the subject site is mapped as the Hartland Formation, a pre-Ordovician (>505 million years) rock unit composed of a basal amphibolite overlain by pelitic schists (metamorphosed oceanic crust and overlying sediments) (Fisher et al., 1970). This unit has been thrust over the rocks of the Manhattan prong during the Taconic orogeny, creating abundant low-angle faults and other zones of weakness. The distribution and abundance of these features varies both regionally and locally, but where present, they serve as groundwater conduits. The presence or absence of bedrock structures cannot be discussed here, as the bedrock was not included in the scope of this investigation. The bedrock is not exposed in the vicinity, and is mantled by approximately 10-20 feet of unconsolidated glacial till.

The subsurface geology as determined from six of the seven test borings is illustrated on Figure 7, which includes two cross sections (A-A' and B-B') that strike northeast across the site.
Based on the results of groundwater monitoring on August 1 and 9, 2002, the direction of groundwater flow beneath the site is to the east, towards Echo Bay at an average gradient of 0.2 ft/ft. The direction of groundwater flow is consistent with the topography observed at the site. Whenever free-phase hydrocarbon was detected in a monitor well, the depth to water was corrected for by calculating the hydraulic head according to the following:

$$h_c = h_m - (H_0 \rho_o / \rho_w)$$

Where:
- \(h_c\) = corrected hydraulic head
- \(h_m\) = measured depth to water
- \(H_0\) = thickness of free-phase hydrocarbon layer
- \(\rho_o\) = specific gravity of hydrocarbon (0.73 for gasoline)
- \(\rho_w\) = specific gravity of water (assumed 1.0)

HES calculated hydraulic conductivity (K) at each monitor well according to the method of Bouwer and Rice (1976) and Bouwer (1989). Hydraulic conductivity is a measure of the ease through which water moves horizontally through an aquifer, expressed in units of length versus time. This parameter was calculated at each well according to the results of a “slug” test, in which the hydraulic head is instantaneously changed (by a change in water level in well), and the recovery rate is measured. This method provides a measure of hydraulic conductivity in the vicinity of each well, rather than of the aquifer body as a whole. The Bouwer and Rice method employs the following formula:

$$K = \frac{r_c^2 \ln(R_e/r_w) \ln(y_0/y_t)}{2Lt}$$

where:
- \(r_c\) = radius of well casing
- \(R_e\) = effective radius over which head is dispersed
- \(r_w\) = \(r_c\) plus the radius of the well annulus
- \(y_0\) = (extrapolated) change in head at time \(t_0\)
- \(y_t\) = (extrapolated) change in head at time \(t\)
- \(L\) = saturated length of screened interval
- \(t\) = time
In circumstances where the screened interval intersects the water table, such as found at the subject site, the value \( r_{eq} \) is substituted for \( r_c \). This compensates for the greater radius of the interval through which the water rises.

\[
    r_{eq} = \left[ r_c^2 + n(r_w^2 - r_c^2) \right]^{0.5}
\]

Where \( n \) = the porosity of the sand or gravel pack in the well annulus.

The values of hydraulic conductivity calculated at each well are as follows:

- MW-1: \[5.53 \times 10^{-5} \text{ ft/s} \] or \[4.78 \text{ ft/day} \]
- MW-2: \[5.79 \times 10^{-5} \text{ ft/s} \] or \[28.80 \text{ ft/day} \]
- MW-3: \[1.28 \times 10^{-5} \text{ ft/s} \] or \[6.37 \text{ ft/day} \]
- MW-4: \[4.29 \times 10^{-7} \text{ ft/s} \] or \[0.21 \text{ ft/day} \]
- MW-5: \[1.73 \times 10^{-5} \text{ ft/s} \] or \[8.61 \text{ ft/day} \]
- MW-6: \[2.23 \times 10^{-5} \text{ ft/s} \] or \[11.12 \text{ ft/day} \]

The values and calculations used for each monitor well are summarized in Appendix 4, in addition to a summary of the method employed.

**DISCUSSION OF RESULTS**

The results of laboratory soil analysis reveal that adsorbed BTEX compounds are present in the subsurface. The buried wall that formerly bordered the facility on the Echo Bay margin seems to have acted as a subsurface barrier and prevented hydrocarbon impact of soils on the opposite side of the wall. This is supported by the minimal to nonexistent levels of VOCs in soil samples collected from TB-5 and TB-7, located on the Echo Bay side of the wall. The highest cumulative levels of adsorbed BTEX were detected in samples collected from TB-1 (315,930 µk/kg), and significant cumulative levels of adsorbed BTEX were detected in samples from both TB-2 and TB-3 (122,500 µk/kg and 132,660 µk/kg, respectively). The presence of elevated BTEX levels at these locations is logical given their proximity to the former USTs and spill area located northwest of the automotive repair garage (Figure 2). Given the VOC concentrations observed at TB-1 and TB-2 (>100,000 ppb), it is likely that petroleum hydrocarbon is both adsorbed to the soil and exists as free-phase liquid in interstitial voids in these areas. A comparatively moderate cumulative level (7,060 µk/kg) of adsorbed BTEX was also detected in a soil sample from TB-6, and no adsorbed BTEX compounds were detected in soil samples from test borings TB-4, TB-5, and TB-7. The
results of field screening of soil samples with a photoionization detector (PID) demonstrate that the vertical extent of the petroleum hydrocarbon impact to the unconfined aquifer is delineated. This is illustrated by the trend towards hydrocarbon vapors declining with increasing depth, as shown on Figure 7 (geologic cross sections).

Dissolved BTEX (benzene) and MTBE were detected in groundwater beneath the site during the August 1, 2002 groundwater sampling round. The highest detected levels of dissolved BTEX were detected in samples from MW-1 (7,450 µg/L) and MW-3 (4,049 µg/L). The results of groundwater sampling demonstrate that a dissolved gasoline plume exists beneath the site from the former spill area around MW-1, eastward in the downgradient direction toward MW-2 and MW-3. The presence of free-phase hydrocarbon at MW-2 and elevated dissolved BTEX levels at MW-3 confirm that both dissolved gasoline constituents and free-phase hydrocarbon have migrated downgradient away from the original spill source. However, the existing monitor well array has delineated the areal extent of the recent gasoline spill related to the former USTs at the automotive repair garage. The level of dissolved BTEX compounds at monitor wells MW-4, MW-5, and MW-6 confirms this.

As outlined above, the BTEX compounds are a useful indicator suite for gasoline contamination. They are, however, among the more volatile compounds in gasoline, and groundwater samples from an older (10+ years) gasoline plume may yield reduced levels of BTEX, but elevated levels of less volatile compounds (i.e.: polycyclic aromatic hydrocarbons) may remain. Such compounds would not be detected under an EPA Method 8021 analysis, which includes only aromatic and halogenated volatile organic compounds. This distinction is mentioned in light of the field hydrogeologist's observation of soil cuttings from test boring TB-6 and TB-7. The field hydrogeologist noted a difference in hydrocarbon odor over the test boring interval, and noted both a fresh hydrocarbon odor, and an old hydrocarbon odor. The fact that dissolved benzene was not detected in groundwater samples from MW-6 confirms that the gasoline impact in this area is not recent, but the concentration of the other dissolved BTEX compounds (especially total xylenes) confirms that EPA Method 8021 is an appropriate method for delineating the extent and nature of petroleum contamination in the subsurface at the City Garage facility. Based on these observations, HES believes that the soil contamination observed at test borings TB-5, TB-6, and TB-7 is related to a much older spill, and the historic use as the site as a vehicular maintenance and storage facility for the past 80-odd years.
The tidal influence exerted by Echo Bay and the Long Island Sound suggests that the site subsurface contains a more extensive smear zone than would otherwise be expected. This zone, between the upper and lower limits of water table fluctuation contains residual hydrocarbons, and is somewhat more difficult to remediate effectively than the unsaturated or saturated zones. However, the frequency of tidal fluctuations may serve to flush the smear zone more frequently than occurs in inland sites.

The hydraulic conductivity values calculated at each well are consistent with typical hydraulic conductivity values published for the types of earth materials encountered in the respective test borings. The established range of K values for silty sand extends from 0.01 ft/day to 1,000 ft/day (Freeze & Cherry, 1979). The lowest K value calculated is at MW-4, the point at which the test boring encountered significantly greater amounts of fine sediment than that seen in the other test borings. This supports the anecdotal observations of the field hydrogeologists, who noted that recovery was significantly slower in MW-4 than in the other monitor wells. The results of hydraulic conductivity analyses are given on Figure 6, and reveal that the hydraulic conductivity at the site is relatively low, but may still be suitable for remedial technologies such as pump-and-treat, soil vapor extraction (SVE), dual-phase high vacuum extraction (DPHVE) and/or air sparging (AS).

At the design of the City of New Rochelle, the bedrock aquifer was not included in the scope of this investigation. It is hypothesized, however, that the bedrock interface (approximately 10-20 feet below grade) serves as a confining layer to the observed gasoline constituents in the soil and groundwater beneath the site. Additionally, given the location and siting of the subject facility, HES hypothesizes that there is likely to be an upward hydraulic gradient in the bedrock aquifer, which would also serve to limit downward transport of petroleum hydrocarbons into the bedrock aquifer. Therefore, petroleum hydrocarbon impact to the bedrock aquifer, if any, is expected to be minimal. This could be confirmed by installing deep wells into the bedrock aquifer as a nested well couplet with existing monitor wells.

The Long Island Sound and Echo Bay are sensitive receptors located very near the City Yard. Given the estuarine nature of these water bodies, and use of the Long Island Sound for fishery and recreation, remediation of the recent gasoline spill documented at the subject site is justified, and will likely be required by the NYSDEC.
**SUMMARY / CONCLUSIONS**

Dissolved and adsorbed BTEX compounds are present beneath the subject site, and free-phase liquid hydrocarbon is documented in one of the six monitor wells. The results of field VOC vapor screening of drill cuttings and soil samples, in addition to the results of laboratory analysis of soil and groundwater samples, suggest that the majority of hydrocarbon impact is restricted to the westerly portion of the site. As suggested in the field by the City Engineer, a buried former seawall may impede downgradient hydrocarbon transport.

Hydraulic conductivity beneath the site, as determined by slug tests according to the Bouwer-Rice method, is moderate to low. These results are consistent with the general hydrogeologic properties of the subsurface earth materials observed during drilling of test borings. Therefore, HES expects that downgradient transport of dissolved petroleum hydrocarbons will be restricted. The range of hydraulic conductivities is suitable for remediation technologies such as soil vapor extraction (SVE), dual-phase high vacuum extraction (DPHVE), and/or air sparging (AS).

The nature of future environmental work at the City Garage will be determined by the City of New Rochelle’s plans for the facility and property. Site cleanup options range from installation of a dedicated groundwater and soil vapor recovery system, to excavation of contaminated soil. Given the relatively low permeability of the soils beneath the site, remedial alternatives for the site cleanup include DPHVE (possibly with AS) and possibly AS/SVE. A pilot study must be conducted to determine which remedial alternative will be the most suitable. Short-term application of dual-phase (liquid and vapor) high vacuum extraction may be a viable option for attenuating the hydrocarbon levels in the subsurface, especially if combined with simultaneous air sparging. This method may prove effective at remediating the vicinity of monitor wells MW-1, MW-2 and MW-3. A groundwater treatment system incorporating pump-and-treat technology is not recommended for this site, due to the low permeabilities and reasonably shallow depths to bedrock. Such a system would likely outstrip recovery and dewater the recovery wells, to little advantage. Excavation and removal of contaminated soil is not practical due to the large source area, shallow groundwater table (< 10 ftbg), and extensive aboveground and subsurface obstacles in the vicinity. Additionally, the soil downgradient of the garage facility, especially around MW-4, currently obstructs the downgradient transport of petroleum hydrocarbons, due to their low hydraulic conductivity.
RECOMMENDATIONS

Based on the findings of the above-outlined additional subsurface investigation, HES recommends the following:

- A quarterly groundwater monitoring and sampling program should be instituted to document the fluctuations in dissolved VOCs over time, and free product accumulation in monitor well MW-2.

- HES recommends weekly free-phase product collection from monitor well MW-2. If recovery of free-phase hydrocarbon is slower than anticipated, collection should be reduced to semimonthly or monthly, as appropriate.

- The impact, if any, of the documented spill on the bedrock aquifer should be determined. This should be accomplished by drilling a test boring into bedrock adjacent to three of the existing monitor wells. Three monitoring points is sufficient to investigate the groundwater quality in the bedrock aquifer, and is the minimum number of points required to determine the nature of the hydraulic gradient in the bedrock aquifer. These wells must be properly grouted into bedrock, and isolated from the unconfined aquifer to prevent the potential for cross-contamination.

- A multiple-technology pilot study should be completed to determine which remedial technology will prove the most appropriate for remediation of the documented gasoline spill. Viable technologies for the site conditions as they are currently understood include air sparging, dual-phase high vacuum extraction (possibly in conjunction with air sparging), and soil vapor extraction (possibly in conjunction with air sparging).

APPENDIX 4

SUMMARY OF HYDRAULIC CONDUCTIVITY TESTING AND ANALYSIS
BOUWER-RICE METHOD SUMMARY

K (Hydraulic conductivity)

\[
K = \frac{r_c^2 \ln\left(\frac{R_e}{r_w}\right) \ln(y_0/y_t)}{2Lt}
\]

VARIABLES
- radius (equivalent) \(r_{eq}\)
- radius (casing) \(r_c\)
- effective radial distance \(R_e\)
- saturated screen length \(L\)
- time \(t\)
- drawdown at time \(t\) \(y_t\)
- drawdown at \(t_0\) \(y_0\)

\[
r_{eq} = \left[ r_c^2 + n(r_w^2 - r_c^2) \right]^{0.5}
\]

\(n = \) filter pack porosity

replaces \(r_c\) when water rising in screened interval

Partially-penetrating well
\[
\ln\left(\frac{R_e}{r_w}\right) = \frac{1}{[1.1 / \ln(L_w/r_w)] + [A + B \ln\left(\frac{H - L_w}{r_w}\right) / (L_w/r_w)]}
\]

- \(H = \) saturated thickness
- \(L_w = \) water table to bottom of screened interval
- \(A, B = \) curve constants from Bouwer & Rice (1976)

Fully-penetrating well
\[
\ln\left(\frac{R_e}{r_w}\right) = \frac{1}{[1.1 / \ln(L_w/r_w)] + C / (L_w/r_w)}
\]

- \(C = \) curve constant from Bouwer & Rice (1976)

The values for \(y\) and \(t\) are derived from an extrapolation of the straight-line portion of a semilog plot of \(y\) versus \(t\).

For these analyses, a standard value of 2.55 feet was used for \(R_e\)

Double straight line: ignore initial straight portion, which is due to near-instant recharge from sandpack

Summary adapted from: CDM Federal Programs Corporation (1999) Remedial Investigation Report For the Tennessee Products Site

HydroEnvironmental Solutions, Inc.
Hydraulic conductivity calculations according to the Bouwer-Rice slug test method

\[
K = \frac{r_c^2 \ln(R_w/r_w) \ln(y_0/y_t)}{2Lt}
\]

In cases (such as the subject site) where the screened interval intersects the water table, the value \( r_c \) is replaced by \( r_{eq} \),

\[
r_{eq} = [r_c^2 + n(r_w^2 - r_c^2)]^{0.5}
\]

REGARDING: Site Remediation at City Yard - Supplemental Scope of Work Information

FOR YOUR INFO: x

REVIEW & CALL: Mr. Orszulik,

OTHER MESSAGES: Per our telephone conversation today, attached please find a copy of our supplemental scope of work. Hard copy to follow. Please contact me should you have any questions.

IF THIS MESSAGE IS INCOMPLETE: PLEASE CALL (732) 577-9000

DOES RECIPIENT WANT ORIGINALS BACK: yes

RECEIVER'S FAX NUMBER: 914-654-2195

PLEASE DELIVER IMMEDIATELY
January 13, 2003

Mr. Kaz A. Orszulik
Senior Engineer
City of New Rochelle
Department of Public Works
515 North Avenue
New Rochelle, New York 10801

RF: City of New Rochelle
Request for Proposal Specification No. 4506
Consulting Services for Site Remediation of Contamination at City Yard
Our Project Number 020826200

Dear Mr. Orszulik:

Enclosed please find the supplemental scope of work information that you requested relative to our submission for the referenced Request for Proposal. This information will provide the level of detail necessary to substantiate our cost estimate.

Should you have any questions regarding this supplemental information or our prior submission please contact me.

Very truly yours,

SCHOOR DEPALMA INC.

Neil P. Jiorle
Vice President

Enclosure

City of New Rochelle, New York  
Request for Proposal  
Specification No. 4506  
Consulting Services for Site Remediation of Contamination at City Yard

Scope of Work

This Scope of Work (SOW) is based upon Schoor DePalma's (SD) review and understanding of the City of New Rochelle Request for Proposal Specification No. 4506 (RFP) including, but not limited to, the general project description, technical specifications, and the August 2002 Report of Groundwater and Soil Investigation for Petroleum Contamination for the City Garage Facility prepared by HydroEnvironmental Solutions, Inc. (HES). Our overall approach will conform to the tasks set forth in the RFP, as modified by our interpretation of the findings and recommendations contained in the HES report.

Background

The main source of petroleum hydrocarbon contamination at the City Garage Facility was three (3) former underground storage tanks (UST's) that contained gasoline, diesel fuel, and waste oil. These USTs were removed in 1998, 2001, and 2002 respectively. The sump from a former sewer pump station still exists on site approximately 30' below surface grade (bgs). Although hydrocarbon product and petroleum-contaminated water were removed from this structure in 2001, the potential exists that it could be an ongoing source of groundwater contamination.

It is our understanding that there are currently six (6) groundwater-monitoring wells (MW-1 through MW-5) at the City of New Rochelle Garage Facility (Site), 224 East Main Street, New Rochelle, New York. The monitoring well depths range from 10' to 20' and all of the wells are set in unconsolidated glacial till. HES hypothesizes that the depth to bedrock beneath the Site ranges from 10' to 20' below surface grade (bgs). Separate phase floating product has been detected in one (1) of the monitoring wells, MW-2. Dissolved phase petroleum hydrocarbon contamination has been detected in each of the other five (5) monitoring wells. According to HES, their soil boring and soil sampling program identified “a more extensive smear zone [of residual hydrocarbon contamination] than would otherwise be expected.

Phase I

1. Final Determination of Plume
   We have assumed, from the various components of the RFP that this section refers to the separate phase floating and dissolved phase plume of contamination identified by HES in the unconsolidated glacial till formation that ranges in depth from 10' to 20'. We have interpreted the RFP to indicate that no bedrock monitoring wells are required. We have allowed for the installation of up to four (4) additional monitoring wells to more fully evaluate the contaminant plume. It
is anticipated that none of these wells will exceed 25' in depth. These monitoring wells are to be constructed in accordance with the methodology described and depicted in the RFP Technical Specifications.

It is our opinion that MW-1 does not represent an adequate up gradient monitoring point therefore, we will place one monitoring well (proposed MW-7) approximately 40' to 80' southwest of MW-1 depending upon site logistics and field determination by a staff geologist. It is our opinion that absent UST closure report information to the contrary, the former waste oil UST has not been sufficiently investigated. Therefore, we propose to place one monitoring well (proposed MW-8) at, or within 10’ down gradient of, the former waste oil UST location. It is our opinion that insufficient information is available to determine whether the former gasoline and diesel USTs, or the former sewer pump station, represent the current source of the separate phase floating hydrocarbon contamination in MW-2. Therefore, we recommend placing one monitoring well (proposed MW-9) near the north corner of the building at a point located between the former USTs and former pump station. The precise location will be determined in the field by a staff geologist. Finally, although MW-5 appears to represent a useful down gradient monitoring point, the HES contour maps indicate a two-directional groundwater path. Therefore, in order to obtain have down gradient analytical data relative to MW-2, MW-4, and proposed MW-8, we recommend the installation of a monitoring well (proposed MW-10) at a location 80’ to 100’ due west of MW-2, beyond the edge of the pavement near the top edge of the embankment. All of the proposed monitoring wells will be developed in accordance with the RFP Technical Specifications Section B.

2. Pilot Study
All six (6) existing monitoring wells and all four (4) proposed monitoring wells will be sampled between 14 days and 30 days subsequent to the installation of the proposed monitoring wells. Monitoring well sampling and sample analysis will be in accordance with the RFP Technical Specifications Section C. Based upon the results of their hydrogeologic study, HES indicated that several in-situ technologies might represent feasible remedial strategies. Therefore, along with collecting groundwater samples for laboratory analysis, we may collect other samples for field and laboratory analysis to assist in the design of an appropriate remedial system. The sampling and analytical protocols for this purpose will be coordinated by our remedial design engineer.

3. Design the Remediation System
Based upon the soil boring information generated during the installation of the proposed monitoring wells, the analytical data generated during the Pilot Study, the review of information developed previously by others and published literature data, and our corporate experience with similar projects, we will design a remediation system with a data quality objective of obtaining compliance with the New York State Department of Environmental Conservation (NYSDEC) Groundwater Quality Standards (GQS).
Phase II

1. Construction/Installation of the Remediation System

Inasmuch as the Phase I tasks have not yet been implemented, it is premature to identify the most feasible, cost-effective remedial strategy. However, HES identified several feasible in-situ technologies that could be implemented as onetime approaches rather than long-term strategies. Assuming this is accurate, and based upon review of limited information presented in the RFP, it is our opinion that we could apply one, or a combination, of these methodologies or introduce an alternate approach that could attain compliance with the GQS. Specifically, we have successfully applied Surfactant Enhanced Aquifer Remediation (SEAR) in combination with high vacuum dual-phase extraction (HVDPE) to address similar types of contamination.

The proposed workplan for the surfactant-enhanced HVDPE remediation is summarized below:

- The necessary permits (i.e., National Pollutant Discharge Elimination System - Underground Injection Control) will be obtained from the NYSDEN authorizing the surfactant enhanced HVDPE remediation.

- Injection/extraction points will be installed at the Site at locations to be determined. Each point will consist of a 2-inch slotted polyvinyl chloride (PVC) screen. The screen at the extraction points will extend from 8' to 10' bgs, while the screen at the injection points will extend from 5' to 7' bgs. At both the injection and the extraction points a 2-inch solid PVC riser will extend from the top of the screen to grade. The solid riser will be sealed with a bentonite/cement mixture, or equivalent, to prevent short-circuiting during high vacuum extraction. Well permits will be obtained from the NYSDEN prior to installation of these injection/extraction points.

- Initial groundwater sampling and laboratory analysis will be conducted to establish the baseline level of methyl blue active substances (MBAS) prior to surfactant dosing using Method 5540C from Standard Methods for the Examination of Water and Wastewater, 18th Edition. The sample used to establish the baseline level will be obtained from a centrally located injection/extraction point.

- The impacted soils will be dewatered in preparation for surfactant flushing via the more deeply screened extraction points. These points will be manifolded to a common header(s) connected to a diaphragm, or equivalent, dewatering pump. The dewatering system will be continuously operated until the saturated, impacted soils have been adequately dewatered. SD is proposing to treat the recovered groundwater on site using a temporary system that discharges the treated effluent to the local storm sewer system. Based on the qualitative hydrogeological characteristics of the site, SD will size the proposed dewatering system for
a maximum sustained flow rate of fifty (50) gallons per minute (gpm). However, due to the unpredictability of actual flow rates generated during dewatering projects, SD proposes the use of a 6,500-gallon portable storage tank to provide flow equalization. Additionally, the tank will provide preliminary treatment via separation of any LNAPL and the settling of suspended solids. Dewatering activities will likely be initiated several days in advance of the actual surfactant injection. As a result, this will provide a period of operational flexibility where both the recovery and the flow equalization components of the dewatering system can be easily modified in response to actual flow rates. If necessary, additional dewatering pumps and/or flow equalization capacity will be deployed to the site during this initial period. A transfer pump at the storage/equalization tank(s) will initially direct the groundwater flow through a bag type sediment filter for additional removal of suspended solids. The process flow will then be directed through two (2) granular activated carbon (GAC) vessels configured in series for the adsorption of dissolved phos or organic compounds and other petroleum based constituents. Each carbon vessel will be rated for a flow rate of fifty (50) gpm. The process flow will pass through a flow meter prior to discharge in order to monitor both the instantaneous flow rate and the total cumulative volumetric flow.

- Once the impacted soils have been dewatered, up to seventy-five (75) gallons of a three percent (3%) volumetric solution of surfactant will be gravity/pressure fed at each of the proposed injection points. The dosing will likely be enhanced using a vacuum truck for HVDPE at the adjacent extraction points in order to induce surfactant flow through the impacted soils. In order to ensure contact with the entire impacted strata, up to seventy-five (75) gallons of a three percent (3%) volumetric solution of surfactant will also be gravity/pressure fed at each of the proposed extraction points once the dosing at the injection points has been completed. The quantity of surfactant dosed and the rate of injection will ultimately be dependent upon aquifer acceptance. The surfactant will be allowed to equilibrate in the subsurface for a period of approximately seventy-two (72) hours to maximize emulsification and desorption prior to extraction.

- At the conclusion of the equilibration period, HVDPE will be initiated at the centrally located extraction points via a vacuum truck connected to the dewatering header(s). In addition to ensuring capture of the surfactant and the emulsified LNAPL, this approach will result in further washing/flushing of the most impacted soils. The vacuum truck will then be utilized at the surrounding extraction points, both individually and/or in various combinations. This will enable the extraction to be concentrated in targeted areas. HVDPE may also be performed at the injection points to ensure complete capture of the surfactant. The recovered groundwater, LNAPL, and groundwater/surfactant/LNAPL emulsion will be collected in
the vacuum truck. These extracted liquids will then be transported off-site for disposal at an appropriate facility.

2. Construction Inspection Services

SD will provide contractor coordination and construction inspections services during the installation of the remediation system which will include monitoring, sampling, and analysis. Post-injection groundwater sampling and laboratory analysis will be conducted at two (2) centrally located extraction points thirty (30) days after each surfactant enhanced NVDPE event to ensure total removal/breakdown of the surfactant. The sample will be analyzed using Method 5540C from Standard Methods for the Examination of Water and Wastewater, 18th Edition. In addition, post-injection soil samples will be obtained two (2) locations to be determined. These samples will be analyzed for both TPHC and VO+10 in order to assess the performance of the surfactant-enhanced remediation. Additionally, all six (6) existing monitoring wells and all four (4) proposed monitoring wells will be sampled to assess the performance of the SBR. Monitoring well sampling and sample analysis will be in accordance with the RFP Technical Specifications Section C.

3. Report on the Effectiveness of the System

A report will be prepared summarizing the results of the surfactant enhanced, NVDPE event. The report will include information pertaining to the method of surfactant dosing, surfactant concentration, volume of surfactant dosed, and the groundwater recovery rate/volumes. The report will also include the post-remedial soil and groundwater analytical results. Recommendations for the performance of additional surfactant enhanced, NVDPE events will be based on an evaluation of these analytical results.

It must be emphasized that any proposed Phase II activities are based upon the limited information contained in the RFP and are completely contingent upon the results of the Phase I activities and our review of any additional background site information that might be available. We reserve the right to modify, or completely withdraw, our Phase II proposal pending the results of the Phase I activities.
Mr. Richard Delahunty  
Foster Wheeler Environmental Corporation  
1000 The American Road  
Morris Plains, NJ  
07950-

Dear Mr. Delahunty:

This is to acknowledge receipt of your Freedom of Information Law request seeking:

Records re: City Yard, 224 Main Street, New Rochelle

I have referred your request to the following Records Custodian(s) / Freedom of Information Law Coordinator(s) who may possess the records you are requesting:

Ms. Antoinette Norfleet - Environmental Remediation  
625 Broadway  
Albany, NY 12233-7012  
(518) 402-9750

Mr. Michael Knipfing - Region 3  
21 South Putt Corners Road  
New Paltz, NY 12561-1696  
(845) 256-3052

You may expect a response to your request by 3/20/03.

If I can be of further assistance, please contact me at  (518) 402-8000 Refer to request number 03-239 if you write or call.

Sincerely,

Ruth L. Earl  
Records Access Officer
UNITED STATES ENVIRONMENTAL PROTECTION AGENCY
EPA Region 2, 290 Broadway, 26th Floor (PAD)
NEW YORK, NY 10007

Request Acknowledgment

Mr. Richard Delahunt
Foster Wheeler Environmental Corporation
1000 The American Road
Morris Plains, NJ 07950

RE: Freedom of Information Act (FOIA), 5 U.S.C. 552
Request No. 02-RIN-00890-03

Dear Mr. Delahunt:

Thank you for your FOIA request, dated February 24, 2003, and received in this office on
February 27, 2003, for records related to THE CITY YARD
224 MAIN STREET
NEW ROCHELLE, NY 10801. The Agency has twenty (20) working days to respond to your request,
except when you have agreed to an alternate due date or unusual circumstances exist that would require
an extension of time under 5 U.S.C. 552(a)(6)(B). Please be advised that in accordance with the EPA's
revised FOIA regulations (40 CFR 2.100, et. seq.), effective November 5, 2002, the Agency's fees for
processing requests have changed. The new fee schedule is as follows:

- Clerical staff time billed at $4.00 per 15 minutes of search and/or review
- Professional staff time billed at $7.00 per 15 minutes of search and/or review
- Managers' time billed at $10.25 per 15 minutes of search and/or review
- No fee will be charged for services at or below $14.00
- Assurance of payment of fees above $25.00 will be obtained from the requester
  before commencing any work
- Advance payment of fees above $250 may be required by the Agency before
  commencing any work

We hope to respond to you soon. In the interim, please contact us if you have any questions
about your request. Please cite your FOIA request number in all communications.

Sincerely,

Freedom of Information Officer - Public Affairs Division
Office: (212)637-3668
Fax: (212)637-5046

224 MAIN ST NEW ROCHELLE - MUNICIPAL GARAGE SPILLS 9712899, 9803810, 9206991, 0101307, 9102890, 9800763, 9713578
DATE RECEIVED: FEBRUARY 27, 2003

DEAR RICHARD DELAHUNTY:

This letter acknowledges receipt of your request for access to records under New York State's Freedom of Information Law (FOIL). Your request has been forwarded to B. Yukoweic of the Spill Prevention and Response Program(s). Please find enclosed spill summary sheets for the above mentioned area. You should contact the Spills Program directly at (845) 256-3176 for access to any records they may have in their custody.

Please send in a check or money order made payable to NYS DEC in the amount of $3.50 for 14 pages.

If all records are not provided because the records are excepted from disclosure, you will be notified of the reasons and of your right to appeal the determination.

If programs have records, you will have an opportunity to arrange to obtain access to the records. There is no charge to review records or for copies of seven or fewer pages. By law, copy charges will not exceed 25 cents per page or the actual cost of copying. Photographs, maps, oversized documents, videotapes or audio tapes generally cost more than 25 cents per page to copy. You may be required to pay a deposit prior to copies being made and/or to pay all copy charges prior to copies being sent. Please call us if more than one person will review the records so that we can set up an appropriate area for your use.

If you have questions about the status of your request, you may write to this office at the above address or call (845) 256-3000 and follow instructions to reach the desired FOIL contact person.

FREEDOM OF INFORMATION ACT LETTERS
Mr. Richard Delahunt
Foster Wheeler Environmental Corporation
1000 The American Road
Morris Plains, NJ 07950-

Dear Mr. Delahunt:

This is to acknowledge receipt of your Freedom of Information Law request seeking:

Records re: City Yard, 224 Main Street, New Rochelle

I have referred your request to the following Records Custodian(s) / Freedom of Information Law Coordinator(s) who may possess the records you are requesting:

Ms. Antoinette Norfleet - Environmental Remediation
625 Broadway
Albany, NY 12233-7012 (518) 402-9750

Mr. Michael Knipling - Region 3
21 South Putt Corners Road
New Paltz, NY 12561-1696 (845) 256-3052

You may expect a response to your request by 3/20/03.

If I can be of further assistance, please contact me at (518) 402-8000. Refer to request number 03-239 if you write or call.

Sincerely,

Ruth L. Earl
Records Access Officer
Mr. Richard Delahunty  
Foster Wheeler Environmental Corporation  
1000 The American Road  
Morris Plains, NJ 07950  

RE: Freedom of Information Act (FOIA), 5 U.S.C. 552  
Request No. 02-RIN-00890-03  

Dear Mr. Delahunty:  

Thank you for your FOIA request, dated February 24, 2003, and received in this office on February 27, 2003, for records related to THE CITY YARD  
224 MAIN STREET  
NEW ROCHELLE, NY 10801. The Agency has twenty (20) working days to respond to your request, except when you have agreed to an alternate due date or unusual circumstances exist that would require an extension of time under 5 U.S.C. 552(a)(6)(B). Please be advised that in accordance with the EPA's revised FOIA regulations (40 CFR 2.100, et. seq.), effective November 5, 2002, the Agency's fees for processing requests have changed. The new fee schedule is as follows:  

- Clerical staff time billed at $4.00 per 15 minutes of search and/or review  
- Professional staff time billed at $7.00 per 15 minutes of search and/or review  
- Managers' time billed at $10.25 per 15 minutes of search and/or review  
- No fee will be charged for services at or below $14.00  
- Assurance of payment of fees above $25.00 will be obtained from the requester before commencing any work  
- Advance payment of fees above $250 may be required by the Agency before commencing any work  

We hope to respond to you soon. In the interim, please contact us if you have any questions about your request. Please cite your FOIA request number in all communications.  

Sincerely,  

Freedom of Information Officer - Public Affairs Division  
Office: (212)637-3668  
Fax: (212)637-5046

MORRIS PLAINS NJ 07950

RE: FOIL #163-3/03
ALBANY #03-239
224 MAIN ST NEW ROCHELLE - MUNICIPAL GARAGE SPILLS 9712899, 9803810, 9206991, 0101307, 9102890, 9800763, 9713578
DATE RECEIVED: FEBRUARY 27, 2003

DEAR RICHARD DELAHUNTY:

This letter acknowledges receipt of your request for access to records under New York State's Freedom of Information Law (FOIL). Your request has been forwarded to B. Yukoweic of the Spill Prevention and Response Program(s). Please find enclosed spill summary sheets for the above mentioned area. You should contact the Spills Program directly at (845) 256-3176 for access to any records they may have in their custody.

Please send in a check or money order made payable to NYS DEC in the amount of $3.50 for 14 pages.

If all records are not provided because the records are excepted from disclosure, you will be notified of the reasons and of your right to appeal the determination.

If programs have records, you will have an opportunity to arrange to obtain access to the records. There is no charge to review records or for copies of seven or fewer pages. By law, copy charges will not exceed 25 cents per page or the actual cost of copying. Photographs, maps, oversized documents, videotapes or audio tapes generally cost more than 25 cents per page to copy. You may be required to pay a deposit prior to copies being made and/or to pay all copy charges prior to copies being sent. Please call us if more than one person will review the records so that we can set up an appropriate area for your use.

If you have questions about the status of your request, you may write to this office at the above address or call (845) 256-3000 and follow instructions to reach the desired FOIL contact person.

EXECUTIVE SUMMARY

Foster Wheeler Environmental Corporation (Foster Wheeler Environmental) is submitting this Brownfields Site Background Memorandum for the Mancuso Marina property (Marina) to the United States Environmental Protection Agency (EPA), in response to EPA Work Assignment Number 039-SISI-02ZZ issued under EPA RAC II Contract Number 68-W-98-214. This report is based upon, and is consistent with EPA guidance.

The Marina property is owned by the City of New Rochelle and is currently vacant. The property is an irregular shaped parcel of land including 1.23 acres and is bound by Huntington Place to the north, a concrete plant to the east, Echo Bay to the south, and the Landscape Depot to the west. Site improvements at the Marina property include three buildings and a boat dock. The Marina is located on Huntington Place in New Rochelle, Westchester County, New York 10801 (Section 1 Block 84 Lot 110). There is no street number assigned to the property. The area is currently zoned M-3, which is identified as heavy manufacturing. Mixed commercial properties including restaurants, delicatessens, car dealers and small retail shops line Main Street in the vicinity of the Marina. Residential properties dominate the secondary streets to the north, south and west.

The Marina is contiguous to Echo Bay of the Long Island Sound and is located within the Westchester County Designated Long Island Sound Critical Area. The topography of the property slopes gently to the southeast with elevations ranging from 0 to 10 feet above Mean Sea Level (MSL). All portions of the Marina property occur within the 100-year floodplain. The site soils are identified as Urban land where at least 60 percent of the land surface is covered with buildings or other structures. Coastal Shoals/Bars/Mudflats (SM) tidal wetlands are present along the southwest corner of the Marina property in Echo Bay.

Three well databases (Federal USGS, Federal FRDS Public Water Supply (PWS), and State Database) were searched by EDR for the occurrence of potable water wells within a one-mile radius of the Marina. Six Federal USGS wells and one Federal FRDS Public Water Supply well were located within one mile of the property. One of the wells was identified as unused. The primary use of water for the remaining wells include commercial (three wells) and industrial (two wells). The PWS well currently has or had major violation(s) or enforcement actions. Information regarding the direction of ground water flow was not provided by EDR.

Foster Wheeler Environmental's investigation identified the following areas of concern and associated recommendations.

- **Spills** – Two spills were reported at the Marina property. It is recommended that supplemental information regarding site spills be reviewed and that soil and groundwater sampling be performed in the vicinity of the identified spills.

- **Fill Material** – According to Lane Appraisals, Inc. (1996), the southeast corner of the Marina property (about 3,500 square feet) has been filled. This area lies above the water level and is not connected to the remaining upland areas. The origin of this fill material is not known. Therefore, sampling of the material is recommended to determine if any environmental impacts have resulted from the introduction of this material to the property.
• **Site History** – The Marina property has been used a boat yard since the early 1900s. As such, repair work on motors would involve petroleum products and solvents. In addition, the possibility that hazardous materials including paints, epoxies and solvents were used at the Marina exits. If stained areas are observed during the site inspection, soil sampling should be performed.

• **Transformer** – If it is determined that transformer(s) are present at the property, and stained areas are observed in the vicinity of the transformer(s) during the site inspection, soil sampling should be performed in the stained areas to determine if any environmental impacts have resulted.

• **Lead-based Paint and Asbestos Containing Building Material (ACBM)** – Due to the age of one of the buildings at the Marina, the possibility of the presence of lead-based paint and ACBM in the structure exists. If suspect material is observed during the site inspection, sampling of the material is recommended to be performed.

• **Drains** – If it is determined that floor drains are present within the Marina’s structures, then the discharge points should be identified and samples should be collected in the drain and at the discharge location, if possible.

• **Consolidated Edison property** – A former Consolidated Edison substation was located on Echo Avenue between 0.125 and 0.25 mile to the south southwest of the Marina at a higher elevation. Cleanup activities to remove PCB contaminated soil and sediment from the Consolidated Edison property, adjacent commercial and residential properties, and the Echo Bay tidal lands are almost complete. It is recommended that soil and sediment samples be collected from the southern portion of the Marina along Echo Bay and analyzed for PCBs.

• **New Rochelle City Yard** – A 2,000-gallon gasoline underground storage tank (UST) failed at the New Rochelle City Yard site located between 0.125 and 0.25 mile north northeast of the Marina. It is recommended that groundwater samples be collected from the Marina property to evaluate potential impacts to the Marina from the City Yard site.
1.0 INTRODUCTION

The City of New Rochelle, Westchester County, New York proposes to construct a mixed-use residential waterfront community on lands contiguous to Echo Bay. The project will expand across several City-owned properties including the Mancuso Marina property (Marina property). Usage of the proposed community will include approximately 336,300 square feet residential, 32,500 square feet commercial/office, and 24,000 square feet specialty retail. The proposed project will also improve public access to Echo Bay.

This Draft Brownfields Site Background Memorandum presents the findings of a background investigation of the 1.23-acre Marina property. Foster Wheeler Environmental Corporation (Foster Wheeler Environmental) conducted this assessment in response to the United States Environmental Protection Agency (EPA) Work Assignment Number 039-SISI-02ZZ issued under EPA RAC II Contract Number 68-W-98-214. This report is based upon, and is consistent with, EPA guidance for completion of a Preliminary Site Assessment.

1.1 Objectives

The goal of the Brownfields Site Inspections (BSIs) being performed under this Work Assignment is to provide a detailed characterization of environmental conditions at Brownfields Sites that have redevelopment potential. The four primary objectives of the BSIs are:

- Determine the nature and extent of contamination on the site;
- Determine the risks posed by the contamination;
- Determine the potential remedial alternatives to minimize continued risks to human health and/or the environment; and
- Estimate costs of identified cleanup options in the scope of site redevelopment.

The first phase of the BSI is a background investigation, which is the subject of this report. Foster Wheeler Environmental performed a review of background information of the Mancuso Marina property in New Rochelle, New York in order to obtain information on environmental issues related to past and current use of the property to assist EPA in identifying the possibility of recognized environmental conditions.

1.2 Scope of Work

The following tasks were included in preparing the Brownfields Site Background Memorandum for the Marina property:

Task 1: Evaluate Existing Data and Documents

In order to identify existing environmental conditions at the Marina property, and determine whether contamination has been previously documented for the Marina property, Foster Wheeler Environmental performed an evaluation of existing, available files and documents. Foster Wheeler Environmental obtained and reviewed existing background information, including: Sanborn Fire Insurance Maps, aerial photographs, US Department of the Interior, Geological Survey (USGS)
Topographic maps, United States Fish and Wildlife Service (USFWS) National Wetland Inventory (NWI) maps, New York State Department of Conservation (NYSDEC) wetlands maps, tidal wetlands maps, the county soil survey, and Federal Emergency Management Agency (FEMA) Flood Insurance Maps (FIRM). In addition, Freedom of Information Act (FOIA) letters were submitted to the relevant regulatory agencies requesting a review of all files pertaining to the Marina property.

Task 2: Environmental Regulatory Database Search

Foster Wheeler Environmental obtained a commercially available database report of a search of federal and state regulatory databases to determine the possible presence of hazardous substance or petroleum products at or within the proximity of the Marina property.

Task 3: Conduct Select Interviews

Interviews were conducted with property owners of the Marina property. As the property was owned by the City of New Rochelle, interviews were restricted to City personnel. Site visits were not included in this phase of work; therefore, interviews were conducted with Planning Department and Department of Public Works personnel at the City office. Telephone interviews were also conducted with relevant City personnel. Any pertinent files or contacts associated with the Marina property were obtained during the interviews.

Task 4: Prepare Brownfields Site Background Memorandum

This Brownfields Site Background Memorandum summarizes general site characteristics, including current and historical site use, geology, hydrology, and the presence of surface water features. In addition, a summary of potential and/or known environmental concerns was documented, and an inventory of water supply wells (public or private) within one mile of the Marina property was compiled.

1.3 Special Terms and Conditions

Foster Wheeler Environmental’s assessment represents a review of certain information relating to the Marina property that was obtained by methods described above and did not include a site visit, sampling or other monitoring activities at the property. While Foster Wheeler Environmental has used reasonable care to avoid reliance upon data and information that is inaccurate, Foster Wheeler Environmental is not able to verify the accuracy or completeness of all data and information available during the investigation and some of the conclusions would be different if the information upon which they are based is determined to be false, inaccurate, or incomplete. Foster Wheeler Environmental makes no legal representations whatsoever concerning any matter, including, but not limited to, ownership of any property or the interpretation of any law. Foster Wheeler Environmental further disclaims any obligation to update the report for events taking place after the time during which the assessment was conducted.
1.4 Limiting Conditions

A site reconnaissance was not included in the scope of work for this portion of the project. Therefore, data pertinent to performing an accurate evaluation of the environmental conditions of the Marina property (i.e. staining, material storage practices, and the presence of asbestos, lead based paint, tanks, and floor drains) are absent. In addition, all data presented in the report is provided without the benefit of verifying the information in the field.
2.0 SITE DESCRIPTION

The information in this section was obtained from select interviews and a records review. A list of the documents reviewed during the preparation of this Brownfields Site Background Memorandum is provided in Section 6.0.

2.1 Site Location and Legal Description

The Marina property is located on Huntington Place in New Rochelle, Westchester County, New York 10801 (Section 1 Block 84 Lot 110). According to Ms. Kathleen Gill, Deputy Corporation Counsel, City of New Rochelle, there is no street number assigned to the property. Based on Lane Appraisals, Inc.’s appraisal report of the Mancuso’s Boatyard, dated 5 November 1996, Lot 110 formerly consisted of Lots 100 and 110. The Marina property is located along an inlet of Echo Bay. The facility is identified as the Echo Bay Marina in the Environmental Site Assessment Report prepared by Environmental Data Resources, Inc. (EDR). The EDR report is discussed in Section 3.1 and provided in Appendix A. The location of the Marina property is shown on Figure 1, Site Location Plan.

2.2 Site and Vicinity Characteristics

The Marina property lies between Huntington Place and Echo Bay of the Long Island Sound. The City of New Rochelle acquired the property on 7 May 1993 due to non-payment of real estate taxes. The City of New Rochelle does not currently use the property and there are no tenants. A chain-linked fence along the property’s northern boundary, along Huntington Place, restricts access to the Marina property. Based on a windshield survey of the Marina, the majority of the property’s surface is covered with either a degraded concrete slab or compacted gravel. Several boats were also present in various stages of decay. Scattered vegetative growth was apparent throughout the Marina property.

The property is an irregular shaped, 1.23 acre parcel of land. The Marina property has approximately 223 feet of frontage along the southeasterly side of Huntington Place. According to Lane Appraisals, Inc. (1996), the Marina property includes approximately 27,000 square feet of upland, approximately 23,000 square feet of land under water, and approximately 3,500 square feet of inaccessible filled in land. The topography of the northern portion of the Marina property (upland) is described as relatively level with a slight decline in an easterly direction. The westerly portion of the Marina property rises from the street grade in a southerly direction, levels off, and then slopes downward. The easterly portion of the Marina property is approximately eight feet below street grade. The southern portion of the Marina property is under water (land under water) and had been dredged for docking purposes. The southeast corner of the property has been filled (inaccessible filled in land), resulting in an area that lies above the water level. This portion of the property is not connected to the upland area of the Marina.

The property is bordered by Huntington Place to the north, a concrete plant to the east, Echo Bay to the south, and a garden center (the Landscape Depot) to the west. The area is currently zoned M-3, which is identified as heavy manufacturing. Mixed commercial properties including restaurants, delicaessens, car dealers, and small retail shops line Main Street in the vicinity of the Marina property and residential properties dominate the secondary streets to the north, south and west.
2.3 Site Improvements

Site improvements at the Marina property include three buildings and a boat dock. The property’s oldest building was constructed in 1946 and is an unheated concrete block shed which contains about 140 square feet in building area. The structure is located along Huntington Place in the center of the parcel. The two remaining buildings are steel-framed structures on concrete foundations. The walls and roofs are constructed of beveled sheet aluminum and corrugated steel, respectively. The smaller of the two buildings is a one-story 800 square feet garage/office building. The structure was built in 1968 and includes approximately 240 square feet of office space. The facility’s largest building, a one and part two-story boat storage building, was constructed in 1990 but never completed. The first floor is 2,440 square feet in size and the second floor is 1,635 square feet in size. Little information regarding the boat dock was provided. Lane Appraisals, Inc. (1996) identifies dock space for approximately 40 boats.

2.4 Current Uses of the Property

As previously stated, the Marina property is owned by the City of New Rochelle. The City acquired the property due to non-payment of taxes. Due to a legal action brought against the City by the property’s former owner, the previous owner maintained occupancy of the property until 1997. The City does not currently use the property and there are no tenants. According to Mr. Lewis Wendell, Deputy Commissioner, Department of Development, for the City of New Rochelle, the concrete plant is encroaching on the Marina property. Ms. Gill added that she believed Mr. Mancuso had an informal agreement with the concrete plant, which enabled them to store heavy equipment at the Marina property. The City is in the process of removing the concrete plant equipment from the property.

2.5 Past Uses of the Property

Mr. Mancuso purchased the Marina property from Mr. and Mrs. Peter Kohlasch on 6 October 1987, and then constructed the 2,440 square foot boat storage building. Believing that his property was contaminated due to a faulty City sewer system, Mr. Mancuso sued the City of New Rochelle. Suspecting the Consolidated Edison facility and Thruway Authority may have also contaminated his property, Mr. Mancuso also sued them. The City of New Rochelle acquired the Marina property in 1993 due to non-payment of real estate taxes. Mr. Mancuso was allowed to occupy the property until the legal actions were settled. All cases initiated by Mr. Mancuso regarding the Marina were dismissed and, in 1997, Mr. Mancuso vacated the premises. The City is in the process of obtaining payment in the form of rent for the last four years from Mr. Mancuso.

The Sanborn fire insurance maps identify a boat house on the property in 1911 and a boat yard on the property in 1990.

2.6 Current and Past Uses of Adjoining Property

The Marina property is bordered by Huntington Place to the north, a concrete plant to the east, Echo Bay to the south, and the Landscape Depot to the west. Based on the Sanborn fire insurance maps, a “boat builder” building was located on the concrete plant property in 1911. The concrete plant building, on the concrete plant property, and parking and several small structures, on the landscape property, are identified by the Sanborn fire insurance maps as being present since at least 1990.
3.0 RECORDS AND DATA REVIEW

3.1 Regulatory Agency Database Search

This section of the report is a compilation of Federal, State, and local environmental databases. This information is as current as the most recently updated database. However, due to the dynamic nature of environmental laws and data reporting, this information will change over time.

A search of available environmental records was performed by EDR, and a report was issued to Foster Wheeler Environmental on 21 February 2003. Foster Wheeler Environmental did not participate in the research or compilation of the records report. A copy of this report is provided in Appendix A. Databases reviewed for the Marina property and surrounding properties, and the associated search radii include:

• NPL - National Priority List. The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. This database was last issued on 24 October 2002, and the search distance was one mile.

• Proposed NPL – Proposed National Priority List Sites. The source of this database is the EPA. The latest version of this database was issued on 24 October 2002, and the search radius was 1 mile.

• CERCLIS - Comprehensive Environmental Response, Compensation, and Liability Information System. CERCLIS contains data on potentially hazardous waste sites that have been reported to the EPA by states, municipalities, private companies, and private persons pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). CERCLIS contains sites that either are proposed to or are on the NPL and sites that are in the screening and assessment phase for possible inclusion on the NPL. This database was last issued on 13 December 2002, and the search distance was 0.5 mile.

• CERCLIS-NFRAP – CERCLIS No Further Remedial Action Planned. As of February 1995, CERCLIS sites designated “No Further Remedial Action Planned” (NFRAP) have been removed from CERCLIS. NFRAP sites may be sites where, following an initial investigation, no contamination was found, contamination was removed quickly without the need for the site to be placed on the NPL, or the contamination was not serious to require Federal Superfund action or NPL consideration. The source for this data is the EPA. This database was last issued on 13 December 2002, and the search distance was 0.25 mile.

• CORRACTS - Corrective Action Report. CORRACTS identifies hazardous waste handlers with Resource Conservation and Recovery Act (RCRA) corrective action activity. This database was last issued on 29 September 2002, and the search distance was 1 mile.

• RCRIS - Resource Conservation and Recovery Information System. RCRIS includes selective information on sites which generate, transport, store, treat, and/or dispose of hazardous waste as defined by RCRA. The EPA and the United States Department of Commerce, National Technical Information Service (NTIS) are the sources of this database. This database was last issued on 9 September 2002, and the search distance was 0.25 mile for Large Quantity...
Generators (LQG) and Small Quantity Generators (SQG), and 0.5 mile for Treatment, Storage, and Disposal (TSD) facilities.

- **ERNS - Emergency Response Notification System.** ERNS records and stores information on reported releases of oil and hazardous substances. The EPA and the NTIS are the sources of this database. This database was last issued on 31 December 2001, and the search distance was limited to the Marina property.

- **BRS – Biennial Reporting System.** The BRS is a national system administered by the EPA that collects data on the generation and management of hazardous waste. BRS captures data from LQG and TSD facilities. The EPA and the NTIS are the sources of this database. This database was last issued on 31 December 1999, and the search distance was not identified in the EDR report.

- **CONSENT - Superfund (CERCLA) Consent Decrees.** Major legal settlements that establish responsibility and standards for cleanup at Superfund sites. The EPA is the source of this database. The issue date for this database varies, and the search distance was 1.0 mile.

- **ROD - Records of Decision.** ROD documents mandate a permanent remedy at an NPL site containing technical and health information to aid in the cleanup. The NTIS is the source of this database. This database was last issued on 21 December 2001, and the search distance was 1.0 mile.

- **Delisted NPL - NPL deletions.** The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425(e), sites may be deleted from the NPL where no further response is appropriate. The EPA supplies this data. This database was last issued on 18 October 2002, and the search distance was 1.0 mile.

- **FINDS - Facility Index System/Facility Identification Initiative Program Summary Report.** FINDS contains both facility information and “pointers” to other sources that contain more detail. EDR includes the following FINDS databases in this report: PCS ( Permit Compliance System), AIRS (Aerometric Information Retrieval System), DOCKET (Enforcement Docket used to manage and track information on civil judicial enforcement cases for all environmental statutes), FURS (Federal Underground Injection Control), C-DOCKET (Criminal Docket System used to track criminal enforcement actions for all environmental statutes), FFIS (Federal Facilities Information System), STATE (State Environmental Laws and Statutes), and PADS Polychlorinated Biphenyls (PCB) Activity Database System). This database was last issued on 10 October 2002, and the search distance was limited to the Marina property.

- **HMIRS - Hazardous Materials Information Reporting System.** HMIRS contains hazardous material spill incidents reported to the Department of Transportation (DOT). This database was last issued on 31 July 2002, and the search distance was limited to the Marina property.

- **MLTS - Material Licensing Tracking System.** MLTS is maintained by the Nuclear Regulatory Commission (NRC) and contains a list of approximately 8,100 sites which possess or use
radioactive materials and are subject to NRC licensing requirements. This database was last issued on 21 October 2002, and the search distance was limited to the Marina property.

- **MINES** – Mines Master Index File. The source of the data is the Department of Labor, Mine Safety and Health Administration. This database was last issued on 10 September 2002, and the search distance was limited to 0.25 mile.

- **NPL LIENS - Federal Superfund Liens.** Under the authority granted the EPA by the CERCLA of 1980, the EPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner receives notification of potential liability. EPA compiles a listing of filed notices of Superfund liens. This database was last issued on 15 October 1991, and the search distance was limited to the Marina property.

- **PADS - PCB Activity Database System.** PADS identifies generators, transporters, commercial stokers, and/or brokers and disposers of PCBs who are required to notify the EPA of such activities. This database was last issued on 20 September 2002, and the search distance was limited to the Marina property.

- **RAATS - RCRA Administrative Action Tracking System.** RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administrative actions after 30 September 1995, data entry in the RAATS database was discontinued due to a decrease in agency resources. The RAATS database is included in this search for historical reasons. This database was last issued on 17 April 1995, and the search distance was limited to the Marina property.

- **TRIS - Toxic Chemical Release Inventory System.** TRIS identifies facilities that release toxic chemicals to the air, water, and land in reportable quantities under SARA Title III Section 313. This database was last issued on 31 December 2000, and the search distance was limited to the Marina property.

- **TSCA - Toxic Substances Control Act.** TSCA identifies manufacturers and importers of chemical substances included on the TSCA Chemical Substance Inventory list. It includes data on the production volume of these substances by plant site. This database was last issued on 31 December 1998, and the search distance was limited to the Marina property.

- **FTTS INSP – FIFRA/TSCA Tracking System.** The EPA provides this information. This database was last issued on 24 October 2002, and the search distance was limited to the Marina property.

- **SSTS – Section 7 Tracking Systems.** Section 7 of the Federal Insecticide, Fungicide and Rodenticide Act as amended (92 Stat. 829). This information is provided by the EPA, and includes types and amounts of pesticides, active ingredients and devices being produced, and those having been produced and sold or distributed in the past year. This database was last issued on 31 December 2000, and the search distance was limited to the Marina property.

- **FTTS – FIFRA/TSCA Tracking System.** Federal Insecticide, Fungicide, & Rodenticide Act (FIFRA)/TSCA. This information is provided by the EPA, Office of Prevention, Pesticides and
Toxic Substances. This database was last issued on 24 October 2002, and the search distance was limited to the Marina property.

- **SHWS – Inactive Hazardous Waste Disposal Sites in New York State.** State hazardous waste site records are the states’ equivalent to CERCLIS. These sites may or may not already be listed on the federal CERCLIS list. The data come from the NYSDEC. This database was last issued on 1 April 2002, and the search distance was one mile.

- **SWF/LF - Solid Waste Facility Directory.** SWF/LF type records typically contain an inventory of solid waste disposal facilities or landfills in a particular state. The information is provided by the NYSDEC. This database was last issued on 31 December 2001, and the search distance was 0.5 mile.

- **LTANKS – Spills Information Database.** Leaking Underground Storage Tank Incident Reports. The records contain an inventory of reported leaking underground storage tank incidents reported from 1 April 1986 through the most recent update. This database was last issued on 1 January 2002, and the search distance was 0.5 mile.

- **UST - Registered Underground Storage Tanks.** USTs are regulated under Subtitle I of RCRA and must be registered with the state department responsible for administering the UST program. The data is provided by the NYSDEC and identifies facilities that have petroleum storage capacities in excess of 1,100 gallons and less than 400,000 gallons. This database was last issued on 1 January 2002, and the search distance was 0.25 mile.

- **CBS UST – Chemical Bulk Storage Database.** The data are provided by the NYSDEC and lists facilities that store regulated hazardous substances in underground tanks of any size. This database was last issued on 1 January 2002, and the search distance was 0.25 mile.

- **MOSF UST – Major Oil Storage Facilities Database.** The data are provided by the NYSDEC and lists facilities that may be onshore facilities or vessels, with petroleum storage capacities of 400,000 gallons or greater. This database was last issued on 1 January 2002, and the search distance was 0.5 mile.

- **VCP – Voluntary Cleanup Agreements.** The program uses private monies to remediate sites and covers virtually any kind of site and contamination. The data are provided by the NYSDEC. This database was last issued on 17 December 2002, and the search distance was 0.5 mile.

- **SWRCY – Registered Recycling Facility List.** The data are provided by the NYSDEC and lists recycling facilities. This database was last issued on 17 July 2000, and the search distance was 0.5 mile.

- **SWTIRE – Registered Waste Tire Storage & Facility List.** The data are provided by the NYSDEC and lists registered waste tire storage facilities. This database was last issued on 1 September 2001, and the search distance was 0.5 mile.
• HSWDS – Hazardous Substance Waste Disposal Site Inventory. The data are provided by the NYSDEC and lists any known or suspected hazardous substance waste disposal sites. This database was last issued on 1 September 2002, and the search distance was 0.5 mile.

• AST – Listing of New York’s Registered Aboveground Storage Tanks. The source of this data is the NYSDEC. This database was last issued on 1 January 2002, and the search distance was limited to the Marina property.

• CBS AST – Chemical Bulk Storage Database. The data are provided by the NYSDEC and lists facilities that store regulated hazardous substances in ASTs with capacities of 185 gallons or greater and/or in USTs of any size. This database was last issued on 1 January 2002, and the search distance was 0.25 mile.

• MOSF AST – Major Oil Storage Facilities Database. The data are provided by the NYSDEC and lists facilities that may be onshore facilities or vessels, with petroleum storage capacities of 400,000 gallons or greater. This database was last issued on 1 January 2002, and the search distance was 0.5 mile.

• SPILLS – Spills Information Database. The data are provided by the NYSDEC and lists data collected on spills active as of 1 April 1986, as well as spills occurring since that date. This database was last issued on 1 January 2002, and the search distance was 0.125 mile.

• MANIFEST – Facility and Manifest Data. The data are provided by the NYSDEC. This database was last issued on 12 September 2002, and the search distance was not identified in the EDR report.

• Coal Gas - Former Manufactured Gas (Coal Gas) Sites. Data provided from Real Property Scan, Inc., and the search distance was 1.0 mile.

3.1.1 Subject Property

According to EDR, Echo Bay Marina, Huntington Place, New Rochelle, New York was listed on the NY Spills database. A petroleum spill of an unknown cause was reported at the property on 7 May 1997. A Coast Guard team identified the spill as unrecoverable road runoff.

Echo Bay Marina (three listings) and Echo Bay Marine (one listing) were also identified on the NY Spills database as orphan sites (unmappable due to inadequate address information). Individual site reports were obtained from EDR for these four orphan sites and are included in Appendix A. Three of the orphan spills involved an unknown quantity of petroleum, and these spills occurred on 6 December 1993, 2 May 1994, and 18 May 1994. Based on EDR’s report, the 6 December 1993 spill was of a known release and corrective action was taken. NYSDEC remarks of 18 September 1996 state that there was “no product since August, the first of two on/off cycles per stipulation will be started and the system was operating.” No additional information was provided for the 2 May 1994 spill. The 18 May 1994 spill class was identified as “No spill occurred, No DEC Response, No corrective action required.” The fourth orphan spill involved an unknown quantity of diesel at the site on 1 January 1992. Stained soil was visible. On 28 April 1997, the NYSDEC sent a letter stating that based on the work performed, the spill was closed.
3.1.2 **Surrounding Properties**

Ninety-two properties were identified on government environmental databases by EDR within the search radius. These surrounding properties were listed on the CERCLIS-NFRAP, CORRACTS, RCRIS-SQG, SHWS, LTANKS, UST, NY VCP, SPILLS, Former Manufactured Gas (Coal Gas) Site, and Brownfields databases. Several of these properties occurred on more than one database. Also, properties were listed on additional databases not identified above, when located outside the database designated search radius. A summary of the environmental database information for the surrounding properties, as provided by EDR, is provided below.

**CERCLIS-NFRAP** - One site, Consolidated Edison on Echo Avenue, is listed on the CERCLIS-NFRAP database. The property is located between 0 and 0.125 mile to the south-southwest of the Marina property at a higher elevation. The completed assessment history includes discovery on 19 April 1988, and archive site and preliminary assessment on 30 September 1992. It is assumed that as there is NFRAP for the Consolidated Edison site, it would pose a limited environmental threat to the Marina property. However, due to the limited information provided by EDR for this database, an accurate determination regarding the Consolidated Edison property as being of environmental concern to the Marina property cannot be made.

**CORRACTS** - One site, Rush Manufacturing Corp at 10-12 Pine CT., is listed on the CORRACTS database. The property is located between 0.5 and 1.0 mile to the west-southwest of the Marina property at a higher elevation. The EPA ID number for the site is identified as NYD075436394. The RCRA Facility Assessment for the property was completed as of 22 September 1992 and the facility was assigned a low corrective action priority as of 3 May 1994. Due to the distance from the site and the low corrective action priority, potential impacts to the Marina property are not expected.

**RCRIS** - Fifteen sites are listed as small quantity generators within 0.25 mile of the Marina property. Eight of these sites are present between 0 and 0.125 mile of the Marina property. All 15 sites are located at a higher elevation than the Marina property. Three facilities are conditionally exempt and two sites transport waste. According to EDR’s report, one of the sites, Consolidated Edison on Echo Avenue, generated 22,260.00 pounds of D008 Waste (lead) in 1999. No violations were reported for these facilities by EDR; therefore, these properties are expected to have minimal to no impact on the Marina property.

**SHWS** – One site, Consolidated Edison on Echo Avenue, is listed on the SHWS database. The property is located between 0 and 0.125 mile west of the Marina at a higher elevation. PCBs were detected in soils and catch basin sediments and on surfaces within structures at the site. Subsequent sampling, following an initial clean-up, showed PCB levels as high as 50 parts per million (ppm) remaining. A preliminary site assessment (PSA) was conducted pursuant to a consent order. It was determined that concentrations of PCBs were still present in soils at levels above the cleanup goals. Additional soils were removed and additional sampling was conducted between 1995 and 1998. Site buildings and structures were removed in 1995. As of 1998, 600 tons of PCB contaminated soil was removed from on and off-site, including residential yards. In addition, backfilling with clean soil was conducted. One final area was to be excavated and backfilled with clean soil in 2002. An exposure assessment and fish and wildlife impact analysis for the off-site mudflat area are reported to be in progress. Due to the close proximity of the SHWS site and the nature and extent of the contamination, possible impacts to the Marina property from this site may occur.
LTANKS – Forty-three sites, between 0 and 0.5 mile of the site, are listed on the LTANKS database. Table 1 lists the site, the date the release occurred, the material released, the quantity released, the cause of the release, and the date that the cleanup ceased.

</tbody>
</table>
All properties are located at a higher elevation than the Marina property except for the Benjamin Residence. NFA determinations were identified for seven of the properties, 370 Main Street, 152 Sutton Manor Road, 75 Rhodes Street, Galesi Enterprises, Mutual Biscuit Company, one of the 5 Anderson Street listings, and Main Library. Cleanup–cessed dates were provided for an additional 19 properties: Powertest, Echo & Main, Goncalves Residence, Scott S/S, Getty S/S, New Rochelle Mun. Yard, The Mall, New Rochelle Marina, Tri Star Hyundai Suzuki, Salesian H.S., Apt. Building, North Ave Reality, 7-Up Bottling Co., Oakhurst Gardens Owners, New Rochell Dodge Inc, New Rochell Dodge, I-95 Exit 16, New Rochelle Public Libr., and Barclays Bank of NY/NA. However, four of these clean-up dates are questionable as they are all identified as June 18, 1953.

A 2,000-gallon UST failed at New Rochelle DPW and Sunoco/A-Plus was determined to be a source of groundwater contamination on 15 River Street. Contaminated soil was discovered during a tank removal at Defender Marine Supply, holes were observed in a tank while it was being pulled at Plastic Works, and a leaking fuel tank was removed at Co-Op. Tanks at 5 Anderson Street and 30 Lincoln Street failed tank tests. The Fire Department responded to the spill at the Naval Armory. The spill was diked but some of the release entered a storm drain that discharges into Long Island Sound. The New Rochelle Department of Public Works had not decided on a cleanup for their reported spill. Minor spills involving a sheen on dirty water in driveway, a tank line leaking at the dispenser, oil sprayed from vent, and an overfilled tank were reported for the Guglielmo Residence, Mario’s S/S, Cerratta, and Municipal Garage sites, respectively. No additional data was provided for the East River Savings Bank, Benjamin Residence, Crabtree Nissan, Mutual Biscuit, and Closed Car Dealership sites.

The NYSDEC has indicated that NFA is necessary for seven of the sites and cleanup–cessed dates (other than June 18, 1953) were provided for additional 15 sites; therefore, little or no impact is expected to the Marina property from these properties. In addition, little to no impact to the property is expected from the four localized minor spills. Due to the lack of information, no determination can be made regarding potential impacts to the Marina property for the remaining LTANKS sites.

UST – Seventeen UST sites are located within 0.25 mile of the Marina property. Table 2 identifies the site, distance and direction from the Marina property, quantity of tanks, tank contents, and tank status.

</table>
Tank capacity data was not provided in the EDR report. As described in Section 3.1, the UST database provides information regarding the presence of registered underground storage tanks. Data regarding releases or leaks from said tanks is not provided. Therefore, properties occurring on the UST database would not be considered an environmental threat to the Marina property based solely on their presence on the UST database.

NY VCP and Brownfields - One site, Consolidated Edison-Cedar St Works-New Rochelle MGP, located between 0.25 and 0.5 mile west-northwest of the Marina property, is listed on the Voluntary Cleanup Agreements and Brownfields databases. Limited information provided in the EDR report includes the agreement type (VCP Agreement) and date signed (25 August 2002). Since no information is provided as to the nature or extent of contamination or the progress of any cleanup activities, an accurate determination as to if the property is an environmental threat to the Marina property cannot be made.

SPILLS - Sixteen spill sites are listed on the NY Spills database. The sites are located between 0 and 0.125 mile from the Marina property and are identified as Nelstad, Huntington Place, Cement Plant, 40 Huntington Place, Storm sewer, Jonel Devel. Corp., Consolidated Edison-Echo Ave., Scot S/S, Roadway, McDonalds, Con Ed, not reported, Retire Electrical Station, Retired Con Ed Sub Sta., Echo Base Substation, and Manhole #12719. The address for the Nelstad and Huntington Place spills are both listed as Huntington Place. A NFA determination was assigned to the 23 September 1998 Nelstad spill which involved the release of five gallons of hydraulic oil from a broken truck line. On 17 December 1993, a one-gallon spill of petroleum was reported in a Storm Sewer at Huntington Place. The spill was cleaned up by E.E.S. and the cleanup ceased as of 10 January 1994. Two spills were listed for 40 Huntington Place under the names Cement Plant and 40 Huntington Place. An unknown quantity of petroleum was observed leaking from a pipe at the Cement Plant into the Sound on 14 April 1994. The clean up ceased on 20 April 1994. The spill class for the 40 Huntington Place spill is listed as “No spill occurred. No DEC Response. No corrective action required.”

Forty gallons of #2 fuel oil was identified in a Storm Sewer on Evans Place on 5 March 1993. Luzon performed the clean up. Evidence of spills was present on the Shoreline Oil Co. and Main Elmsford properties. A NFA determination was assigned to the Jonel Devel. Corp. #2 fuel oil spill that occurred on 6 May 1994 due to equipment failure. Emer. Envir Serv. was hired to investigate fuel oil in subsurface beneath old pipelines. Equipment failure is reported to have caused a 3,400-gallon petroleum spill at the Consolidated Edison-Echo Ave. site on 1 January 1998. The majority of the material (3,300 gallons) was contained in a diked area. The remaining 100 gallons overflowed. The spill was cleaned up by Consolidated Edison.

A gasoline odor was detected in the basement of a neighboring apartment building after the Scot S/S site received a delivery on 1 December 1992. Ten gallons of hydraulic fluid were spilled on the Roadway at 30 Huguenot Street on 24 October 1997 when a line broke on a truck. The spill at McDonald’s occurred on 30 June 2000 and involved children playing with mercury. A cleanup of a minor amount of mercury was performed by Tri-State cleanup.

Three spills occurred at 78 Echo Avenue and one at 78 Echo Place. The sites were identified as Con Ed, not reported, Retire Electrical Station, and Retired Con Ed Sub Stat. The spills included a 100-gallon spill of PCB contaminated wastewater due to equipment failure on 29 December 1997, observations of potential contaminated site soils in February 1 and 2, 1998 (spill classes identified as “No
spill occurred. No DEC response. No Corrective Action Required”), and the detection of a strong odor
of #2 fuel oil in a hole where lead contaminated ash was being removed on 15 February 2000. An
unknown quantity of petroleum was spilled on 16 August 1995 when a building collapsed during
demolition at the Echo Base Substation. One pint of dielectric fluid was spilled at Manhole #12719
due to equipment failure on 19 April 2000.

NYSDEC NFA determinations were issued for the Nelstad and Jonel Devel. Corp. spills and “No spill
occurred. No DEC response. No Corrective Action Required spills” were identified for the 40
Huntington Place, not reported, and Retire Electrical Station; therefore, no impacts to the Marina
property are expected from these five spills. Based on the information provided by EDR, little to no
environmental impacts to the Marina property from the four minor spills associated with the Huntington
Place, Roadway, Mc Donald’s, and Manhole #12719 spills are anticipated. No determination regarding
potential environmental impacts from the remaining seven spills can be made due to the limited
information provided in the SPILLS database.

Former Manufactured Gas (Coal Gas) Site - The New Rochelle Gas Co., 53 Cedar, New Rochelle, NY
is listed as a Coal Gas Site. The site is located between 0.25 and 0.5 mile west-northwest of the Marina
property at a higher elevation. The former coal gas facility is described as being located on the
southeast corner of Spring Street and Cedar (formerly Center) and being subsequently called American
Gas Lite Co. and New York Suburban Gas Co. Due to its distance from the Marina property,
environmental impacts from the Coal Gas Site are not anticipated.

3.1.3 Orphan Sites

Forty-four orphan sites are denoted in the EDR report. Four of these orphan sites, Echo Bay Marina
(three sites) and Echo Bay Marine (one site), are believed to be the Marina property and are discussed
in Section 3.1.1. Of the remaining forty-one orphan sites, thirty-one of the sites are listed on the NY
SPILLS database, four are listed on the UST database, two are listed on the RCRIS-SQG and FINDS
databases, two are listed on the ERNS database, and one is listed on the LTANKS database. Table 3
lists the site name, address and database in which it occurred.

All sites are located in New Rochelle. For reasons previously stipulated, the four sites identified on the
UST database would not pose an environmental concern to the Marina property. The limited
information provided for the remaining orphan sites curtails the possibility of determining if they would
be of environmental concern to the Marina property.

3.1.4 Wells

Three well databases (Federal USGS, Federal FRDS Public Water Supply (PWS), and State Database)
were searched by EDR for the occurrence of potable water wells within a one-mile radius of the Marina
property. Table 4 provides: the database the well was listed by; the well ID number; its distance and
direction from the Marina property; the well depth; and the depth to water table.

The primary uses of water for the Federal USGS wells are identified as commercial (three wells) and industrial (two wells). The remaining USGS well is listed as unused. According to the EDR report, the PWS well currently has or had major violation(s) or enforcement actions. Information regarding the direction of groundwater flow was not provided by EDR. Based on the information provided by the EDR report that the above listed wells are higher in elevation than the Marina property, these wells are not likely to be impacted by the Marina property.

3.2 Freedom of Information Act (FOIA) Requests

Foster Wheeler Environmental submitted FOIA requests to the EPA, NYSDEC, Westchester County Clerk and Westchester County Health Department requesting information on all files regarding the Marina property on 24 February 2003. Based on a telephone conversation with Ms. Melissa Nacerino, Director of Public Affairs, on 26 February 2003, the Westchester County Clerk’s Office does not maintain records of environmental issues.

Acknowledgment letters were received from the Westchester County Health Department (dated 27 February 2003), EPA (dated 27 February 2003), and NYSDEC (dated 6 March 2003). Anticipated responses to the FOIA requests were estimated at within twenty days for the EPA and by 20 March 2003 for the Westchester County Health Department. The response letter from the NYSDEC indicated the FOIA request had been forwarded to the Spill Prevention and Response Program(s) and that the Spills Program should be contacted directly to access their records. Copies of FOIA correspondence are provided in Appendix B. Foster Wheeler Environmental has not received FOIA requests from the Westchester County Health Department, the EPA, and the NYSDEC at the completion of this document. Responses letters from regulatory agencies not received at the completion of this draft report will be forwarded to the EPA as addendums.

3.3 Physical Setting Sources

3.3.1 USGS Topographic Map

The US Department of the Interior, Geological Survey (USGS) Topographic Map Quadrangle (7.5-minute series) for Mount Vernon, N.Y. (dated 1966, photo revised 1979) was obtained to provide information on the Marina property. The topography of the Marina property slopes gently to the southeast with elevations ranging from 0 to 10 feet above mean sea level (msl). Site structural features are not identified on the map. The Marina property and the surrounding area are shown in Figure 1.
3.3.2 Federal Emergency Management Agency Flood Insurance Rate Map

The FEMA FIRM for the City of New Rochelle, New York was reviewed to determine if the Marina property occurs within a flood hazard area. According to panel 6 (community-panel number 360922 0006 C), the entire property occurs within Zone A8, the 100-year floodplain.

3.3.3 Putnam and Westchester Counties Soil Survey

According to the Soil Survey of Putnam and Westchester Counties, New York (1994), the soils at the Marina property are identified as Uf (Urban land). Urban lands are described as areas where at least 60 percent of the land surface is covered with buildings or other structures.

3.3.4 Westchester County GIS database

National Wetland Inventory wetland, NYSDEC wetland, Tidal wetland, hydric soil wetland, and critical environmental area data was downloaded from the Westchester County GIS database. According to this database, Coastal Shoals/Bars/Mudflats (SM) tidal wetlands are present along the southwest corner of the Marina property in Echo Bay. Estuarine non-vegetated (E1UBL) wetlands are identified by NWI as occurring to the northwest of the Marina property along the southeastern edge of Echo Bay. NYSDEC wetlands are not present on or within the vicinity of the Marina property. Westchester County listed hydric soil wetlands are not located on the Marina property. Udorthents, wet substratum (Uc) hydric soils are present on the northern and southern edges of the channel leading into Echo Bay from Long Island Sound. These hydric soils are defined as somewhat poorly drained to very poorly drained soils that have been altered mainly by filling. Based on the County database, the Marina property is located within the Designated Long Island Sound Critical Environmental Area.

3.4 Historical Use Information Sources

3.4.1 Aerial Photographs

Historical aerial photographs for the years 1951, 1959, 1962, 1965, 1969, 1980, 1992, 1993, 1996, and 1999 were reviewed in order to obtain a representative understanding of the Marina property’s developments. Aerial photographs of the Marina property prior to 1951 were not available.

1951 – Due to the scale of the 1951 aerial photograph, detailed site features on the Marina property are not discernable. The Marina property boundaries are barely apparent. A cluster of elongated-oval shaped anomalies, which appear to be boats, are present on the northeastern portion of the property. A boat dock extends south from the Marina property into the bay. Ground scarring, several anomalies, and structures are present on the property adjacent to the Marina to the northeast (current cement plant property). The parcel located southwest of the Marina property (present day Landscape Depot property) is partially vegetated and dotted with what are believed to be automobiles. Twelve aboveground storage tanks are discernable on the property located southwest of the site between the Landscape Depot property and Echo Avenue. A substation and associated buildings are apparent on the Consolidated Edison site located south of the Marina property.
1959 – One structure is apparent in the southwest corner of the Marina property in the 1959 aerial photograph. Oval shaped anomalies, believed to be boats, occupy the remaining portions of the property to the north and east of the building. The boat dock that extends into the bay from the Marina property has increased slightly in size. Two barges are present in the bay, one to the south of the Marina property’s building and one to the west of the cement plant property. An access road extends from Huntington Place near the Marina property north to Main Street. The wastewater treatment plant is present on the 1959 aerial photograph, east of the Marina property across Echo Bay. No apparent changes to the surrounding properties identified for the 1951 aerial photograph were observed in the 1959 aerial photographs.

1962 – The Marina property’s boat dock is absent in the 1962 aerial photograph. Boats are stored in all open areas of the Marina property, including in between the Marina property’s building and the bay. A reduction in vegetation and an increase in parked cars is apparent in the Landscape Depot property located west of the Marina property. Two large piles and several smaller piles are present on the concrete plant property to the east. The access road between Huntington Place and Main Street is visible in the photograph.

1965 – A large boat dock is present in the bay extending from the Marina property, and boats occupy the majority of the Marina property. Automobile parking and possibly either truck parking or boat storage occupy the property to the west, now occupied by the Landscape Depot. Areas surrounding the Marina property still remain the same from the 1962 aerial photograph.

1969 – The Marina property building first identified on the 1959 aerial is absent in 1969. Boats continue to cover the Marina property and a large boat dock extends into the bay from the Marina property. An anomalous structure slightly larger than the surrounding boats, presumably a building, is located in the northwest corner of the Marina property. Little vegetation is left on the Landscape Depot property in 1969 and the area is predominantly used for automobile parking. The structures surrounding the Marina property remain intact.

1980 – The largest structural change is the absence of the boat dock in the bay. The Marina property continues to be occupied by multiple boats and the large rectangular structure in the northwest corner. The structures in the surrounding properties remain the same, except for the absence of the barge that was docked along the coast of the concrete plant east of the Marina property.

1992 – Two buildings are present along the western border of the Marina property in 1992. Approximately one third of the Marina property is occupied by boats. A large boat dock that extends almost completely across the bay is present. The clarity of the 1992 aerial photograph in the vicinity of the Landscape Depot property is poor; however, it appears that the site is mainly used for parking. All tanks have been removed from the structures of the property that lies between the Landscape Depot property and Echo Avenue.

1993 – No apparent changes on the Marina property from 1992 are present on the 1993 aerial photograph. The surrounding properties also exhibited no changes.

1996 – Fewer boats appear to be present on the Marina property and the boat dock is reduced in size. Most of the boats are located on the eastern portion of the property. The Landscape Depot property to the west of the Marina property has been graded and now includes two buildings adjacent to the Marina property. The structures that housed the tanks on the property to the west of the Landscape Depot
property have been removed and an "S" shaped segmented building occupies the site. All structures have been removed from the former Consolidated Edison facility.

1999 – All boats and the boat dock are absent from the Marina property in 1999. No significant changes to the surrounding properties as described for 1996 are apparent in the 1999 aerial photograph.

3.4.2 Sanborn Fire Insurance Maps

EDR Sanborn fire insurance maps for the years 1903, 1911, 1931, 1942, 1951, and subsequent years from 1990 to 1996 were reviewed to ascertain the historical uses of the Marina property located between Huntington Place to the north and Echo Bay to the south. Copies of the maps are provided in Appendix C.

On the 1903 Sanborn fire insurance map (Sanborn map), the block making up the Marina property, and Evans Street and Huntington Place are not illustrated. The property is located north of what is represented in the 1903 Sanborn map.

The road that is currently Evans Street is noted as a private way on the 1911 Sanborn map and Huntington Place is not illustrated. A boathouse and two smaller unnamed structures are located on the Marina property on the 1911 Sanborn. A boat builder house, a smaller structure identified with a "D", and an associated marine railroad are located on the cement plant property to the east of the Marina property. Five structures are located on the parcels located between the Marina property and Main Street. One is labeled Ice Ho., one is identified with a "D" and one is labeled "L." The markings for the two remaining structures are not identifiable. The former Consolidated Edison facility is present to the south of the Marina property across Echo Bay. The facility is identified as Westchester Lighting Co. and includes a main building, associated coal pockets and hoppers, coal yard, and several smaller structures.

Huntington Place is present on the 1931 Sanborn map. All structures identified by the Sanborn map in 1911 on the Marina property, cement plant, and parcels between the Marina property and Main Street have been removed. One structure identified as "HOIST ENG" is present in the southern portion of the cement plant property. The coal yard of the former Consolidated Engineering facility has been converted to a high voltage transformer yard. Several of the facility's structures located to the south of the main building have also changed slightly. Pure Oil Company and Standard Oil Co. of N.Y. are located on the parcel between the present day Landscape Depot property, to the west of the Marina property, and Echo Road. Nine tanks are denoted on the adjoining properties.

Detailed information regarding the Marina property and surrounding sites cannot be determined from the 1942 Sanborn due to the scale. One structure is present straddling the property line between the Marina property and the present day Landscape Depot property. Six structures are identified scattered across the cement plant property. Little change is apparent to the two oil companies and former Consolidated Edison properties on the 1942 Sanborn.

No structures are identified on the Marina property and only one structure is identified on the cement plant property on the 1951 Sanborn. The cement plant structure is located in the northernmost corner of the site. Structures surrounding the three tanks have been added to the Standard Oil Co. of N.Y. property. The coal pockets and hoppers present on the former Consolidated Edison property since 1911 have been removed.
Two structures are identified on the Marina property on the 1990 Sanborn map and the property is labeled “Boat Yard.” One of the Marina property’s structures is labeled “Iron” and the notation for the other structure is not legible. The iron structure is located in the northwest corner of the Marina property and the other structure is located along Huntington Place in the center of the Marina property. The property currently occupied by the Landscape Depot is labeled “parking.” Three structures are present on the cement property and are identified as “Conc Mixing,” “Conc. Mixing Plant Mach Ho,” and “Iron.” The Westchester Lighting Co. facility is identified as Consolidated Edison Company of N.Y. Some of the smaller structures on the former Consolidated Edison property have been removed and the Transformer yard has expanded in size to the east.

According to the 1991 Sanborn map, an additional structure was added to the Marina property by 1991. The building is located along the Marina property’s southwestern boundary between the iron structure and Echo Bay. The Marina property is still identified as a “Boat Yard.” Two buildings are located in the northern corner of the present day Landscape Depot property. Structures on the cement plant and former Consolidated Edison properties remain relatively unchanged on the 1991 Sanborn map. All tanks and associated structures are absent from the oil company properties on the 1991 Sanborn map; however, the facility’s buildings remain. No significant changes to the Marina property or to the previously described surrounding sites other than the former Consolidated Edison facility are apparent on the 1992, 1993, 1994, 1995, and 1996 Sanborns. The Consolidated Edison facility remained unchanged until on the 1996 Sanborn map it was absent.
4.0 INFORMATION FROM SELECT INTERVIEWS

On Wednesday, 5 March 2003, Mr. Robert Chozick and Mr. Richard Delahunty of Foster Wheeler Environmental met with Messrs. Craig King, Commissioner, Department of Development; Lewis Wendell and John Clemente, Deputy Commissioner and City Engineer, respectively, Department of Public Works; and Kaz Orszulik, Senior Engineer, Department of Public Works, all with the City of New Rochelle, New York. The purpose of the meeting was to obtain background information regarding three EPA Brownfields projects including the Marina property. Information obtained during the meeting regarding the Marina property was limited. According to Mr. Wendell, the City, due to non-payment of real estate taxes, had acquired the property. The property was currently vacant and there were no tenants. He added that the concrete plant (the neighboring property to the northeast) was encroaching on the Marina property and that they were in the process of resolving the encroachment issue.

In a follow-up e-mail from Mr. Wendell, dated 5 March 2003, he suggested that Foster Wheeler Environmental contact Ms. Gill regarding information on the Marina. Mr. Delahunty conducted a telephone interview with Ms. Gill on 10 March 2003. Ms. Gill stated that Mr. Mancuso had acquired the Marina property from Mr. and Mrs. Peter Kohlasch in 1987 and that the City of New Rochelle acquired the Marina from Mr. Mancuso in 1993. Mr. Mancuso believed that a City owned sewer system was responsible for contaminating the Marina property, and thus, he filed a lawsuit against the City of New Rochelle. Mr. Mancuso maintained occupancy of the property pending legal outcome of his lawsuit against the City, but vacated in 1997 when his lawsuit was dismissed. The City of New Rochelle is in the process of acquiring rent from Mr. Mancuso for his occupancy of the Marina property between 1993 and 1997. In addition to suing the City of New Rochelle, Mr. Mancuso also filed lawsuits against Consolidated Edison and the Thruway Administration for contaminating the Marina property. These lawsuits were also dismissed. Ms. Gill stated that the City of New Rochelle has not performed an environmental survey or sampling at the Marina property, but that Mr. Mancuso may have. It was Ms. Gill’s understanding that Mr. Mancuso had an informal agreement with the cement plant that allowed them to store heavy equipment and trucks on the Marina property.

Supplemental information on the Marina property was requested and received from Ms. Gill on 11 March 2003 and included information regarding a description of the Marina property and improvements, and a history of the property. The information was obtained from a real estate appraisal performed by Lane Appraisals, Inc. on 5 November 1996. This information is detailed in Section 2, Site Description.
5.0 CONCLUSIONS AND RECOMMENDATIONS

Foster Wheeler Environmental has performed this background investigation of the Marina property on behalf of the EPA. The Marina property is owned by the City of New Rochelle and is currently vacant. The property is an irregular shaped parcel of land including 1.23 acres and is bound by Huntington Place to the north, a concrete plant to the east, Echo Bay to the south, and a garden center (the Landscape Depot) to the west. Site improvements at the Marina property include three buildings and a boat dock. The Marina property is located on Huntington Place in New Rochelle, Westchester County, New York 10801 (Section 1 Block 84 Lot 110). There is no street number assigned to the property. The area is currently zoned M-3, which is identified as heavy manufacturing. Mixed commercial properties including restaurants, delicatessens, car dealers and small retail shops line Main Street in the vicinity of the Marina property. Residential properties dominate the secondary streets to the north, south and west of the Marina property.

The Marina property is contiguous to Echo Bay of the Long Island Sound and is located within the Westchester County Designated Long Island Sound Critical Area. The topography of the Marina slopes gently to the southeast with elevations ranging from 0 to 10 feet above MSL. All portions of the Marina property occur within the 100-year floodplain. The Marina soils are identified as Urban land where at least 60 percent of the land surface is covered with buildings or other structures. Coastal Shoals/Bars/Mudflats tidal wetlands are present along the southwest corner of the Marina property in Echo Bay.

Three well databases (Federal USGS, Federal FRDS PWS, and State Database) were searched by EDR for the occurrence of potable water wells within a one-mile radius of the Marina. Six Federal USGS wells and one Federal FRDS Public Water Supply well were located within one mile of the Mancuso Marina property. One of the Federal USGS wells was identified as unused. The primary use of water for the remaining wells include commercial (three wells) and industrial (two wells). The PWS well currently has or had major violation(s) or enforcement actions. Information regarding the direction of ground water flow was not provided by EDR.

Foster Wheeler Environmental's investigation identified the following areas of concern and associated recommendations.

- **Spills** – According to EDR, Echo Bay Marina, Huntington Place, New Rochelle, New York was listed on the NY Spills database. A petroleum spill of an unknown cause was reported at the Marina property on 7 May 1997. A Coast Guard team identified the spill as unrecoverable road run-off. Echo Bay Marina and Echo Bay Marine were identified on the NY Spills database as orphan sites. Three of the orphan spills involved an unknown quantity of petroleum. The spills occurred on 6 December 1993, 18 May 1994 and 2 May 1994. The 6 December 1993 spill was of a known release and corrective action was taken. NYSDEC remarks of 18 September 1996 state that there was no product since August, the first of two on/off cycles per stipulation will be started and the system was operating. The 18 May 1994 spill class was identified as “No spill occurred, No NYSDEC Response, No corrective action required.” No additional information was provided for the 2 May 1994 spill. A spill of an unknown quantity of diesel was identified at the site on 1 January 1992. Stained soil was visible. On 28 April 1997, the NYSDEC sent a letter stating that based on the work performed, the spill was closed. It is recommended that additional efforts should be made to retrieve supplemental information regarding site spills as part of the ongoing site investigation and that soil and groundwater sampling be performed in the vicinity of the identified spills to evaluate potential subsurface impacts.
• **Fill Material** – According to Lane Appraisals, Inc. (1996), the southeast corner of the property (about 3,500 square feet) has been filled. This area lies above the water level and is not connected to the remaining upland area of the Marina property. The origin of this fill material is not known. Therefore, sampling of the material is recommended to determine if any environmental impacts have resulted from the introduction of this material to the Marina.

• **Site History** – The property has been used as a boat yard since the early 1900s. As such repair work on motors would involve petroleum products and solvents. In addition, the possibility that hazardous materials including paints, epoxies and solvents were used at the Marina exists. If stained areas are observed during the site inspection, then soil sampling should be performed in the stained areas to determine if any environmental impacts have resulted from the former site activities.

• **Transformer** – It has not been determined if transformers are located on the Marina property. However, if present, and staining is observed in their vicinity, then soil sampling should be performed in the stained areas to determine if any environmental impacts have resulted from the transformer.

• **Lead-based paint and Asbestos Containing Building Material (ACBM)** – Due to the age of one of the buildings at the facility, the possibility of the presence of lead-based paint and ACBM in the structure exists. If suspect material is observed during the site inspection, then sampling of the material should be performed to assess the possible presence of lead-based paint and/or asbestos.

• **Drains** – If it is determined that floor drains are present within the facility’s structures, then the discharge points should be determined and samples collected in the drain and at the discharge location, if possible.

• **Consolidated Edison property** – A former Consolidated Edison substation was located on Echo Avenue between 0.125 and 0.25 mile to the south southwest of the Marina property at a higher elevation. According to EDR the facility was listed on the CERCLIS-NFRAP, RCRIS, SHWS, FINDS, TRIS and NY SPILLS databases. Cleanup activities to remove PCB contaminated soil and sediment from the Consolidated Edison property, adjacent commercial and residential properties and the Echo Bay tidal lands are almost complete. The cleanup involved removing contaminated material and covering with clean fill. Based on the EDR report, final remedial activities should be completed in 2002. The SPILL database identifies a petroleum release of 3,400 gallons on 1 January 1998. The release occurred as a result of an oil/water separator malfunction. Most of the spill (3,300 gallons) was contained in a diked area. The remaining 100 gallons overflowed. According to the EDR report, Consolidated Edison cleaned up the spill and the water contained less than 1 ppm PCB. It is recommended that soil and sediment samples be collected from the southern portion of the Marina along Echo Bay and analyzed for PCBs to evaluate potential impacts to the Marina from the former Consolidated Edison facility.

• **City Yard Property** – A 2,000-gallon gasoline UST failed at the New Rochelle City Yard Property located between 0.125 and 0.25 mile north northeast of the Marina property. Approximately 1,400-gallons of free product was pumped out of the basement of a former treatment plant. A groundwater and soil investigation performed by HES concluded that dissolved and adsorbed BTEX compounds were present in the soils and groundwater beneath the City Yard site. Free-phase liquid hydrocarbon was documented in one of six monitoring wells. VOC vapor screening results of drill cuttings and soil samples and analytical results of soil and groundwater samples indicate that the majority of
hydrocarbon impact is restricted to the westerly portion of the site. It is recommended that groundwater samples be collected from the Marina property to evaluate potential impacts to the Marina Property from the City Yard facility.

### BROWNFIELDS DATABASES

Brownfields: Brownfields Site List

### SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified.

Elevations have been determined from the USGS 1 degree Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. EDR's definition of a site with an elevation equal to the target property includes a tolerance of +/- 10 feet. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property (by more than 10 feet). Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in **bold italics** are in(bold italics) multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.
FEDERAL ASTM STANDARD

CERCLIS-NFRAP: As of February 1995, CERCLIS sites designated "No Further Remedial Action Planned" (NFRAP) have been removed from CERCLIS. NFRAP sites may be sites where, following an initial investigation, no contamination was found, contamination was removed quickly without the need for the site to be placed on the NPL, or the contamination was not serious enough to require Federal Superfund Action or NPL consideration. EPA has removed approximately 25,000 NFRAP sites to lift the unintended barriers to the redevelopment of these properties and has archived them as historical records so EPA does not needlessly repeat the investigations in the future. This policy change is part of the EPA’s Brownfields Redevelopment Program to help cities, states, private investors and affected citizens to promote economic redevelopment of unproductive urban sites.

A review of the CERC-NFRAP list, as provided by EDR, and dated 12/13/2002 has revealed that there is 1 CERC-NFRAP site within approximately 0.25 miles of the target property.

CORRACTS: CORRACTS is a list of handlers with RCRA Corrective Action Activity. This report shows which nationally-defined corrective action core events have occurred for every handler that has had corrective action activity.

A review of the CORRACTS list, as provided by EDR, and dated 09/29/2002 has revealed that there is 1 CORRACTS site within approximately 1 mile of the target property.

RCRIS: The Resource Conservation and Recovery Act database includes selected information on sites that generate, store, treat, or dispose of hazardous waste as defined by the Act. The source of this database is the U.S. EPA.

A review of the RCRIS-SQG list, as provided by EDR, and dated 09/09/2002 has revealed that there are 15 RCRIS-SQG sites within approximately 0.25 miles of the target property.

**EXECUTIVE SUMMARY**

**STATE ASTM STANDARD**

SHWS: The State Hazardous Waste Sites records are the states’ equivalent to CERCLIS. These sites may or may not already be listed on the federal CERCLIS list. Priority sites planned for cleanup using state funds (state equivalent of Superfund) are identified along with sites where cleanup will be paid for by potentially responsible parties. The data come from the Department of Environmental Conservation’s Inactive Hazardous waste Disposal Sites in New York State.

A review of the SHWS list, as provided by EDR, has revealed that there is 1 SHWS site within approximately 1 mile of the target property.

</table>

**LTANKS:** Leaking Storage Tank Incident Reports. These records contain an inventory of reported leaking storage tank incidents reported from 4/1/86 through the most recent update. They can be either leaking underground storage tanks or leaking aboveground storage tanks. The causes of the incidents are tank test failures, tank failures or tank overfills.

A review of the LTANKS list, as provided by EDR, and dated 01/01/2002 has revealed that there are 42 LTANKS sites within approximately 0.5 miles of the target property.

EXECUTIVE SUMMARY

STATE OR LOCAL ASTM SUPPLEMENTAL

SPILLS: Data collected on spills reported to NYSDEC is required by one or more of the following: Article 12 of the Navigation Law, 6 NYCRR Section 613.8 (from PBS regs), or 6 NYCRR Section 595.2 (from CBS regs). It includes spills active as of April 1, 1986, as well as spills occurring since this date.

A review of the NY Spills list, as provided by EDR, has revealed that there are 16 NY Spills sites within approximately 0.125 miles of the target property.

### Site Information

**Site:** ECHO BAY MARINA
**Target:** HUNTINGTON PLACE
**Property:** NEW ROCHELLE, NY

**Site 1 of 5 in cluster A**

### Spills
- **Spill Number:** 9701631
- **Region of Spill:** 3
- **Spill Cause:** Unknown
- **Water Affected:** ECHO BAY
- **Spill Date:** 05/07/1997 09:30
- **Cleanup Ceased:** Not reported
- **Last Inspection:** Not reported
- **Corrective Action Plan Submitted:** Not reported
- **Date Spill Entered in Computer Data File:** 05/07/1997
- **Date Region Sent Summary to Central Office:** Not reported

### Spill Details
- **Investigator:** GHOSAY
- **Caller Name:** Not reported
- **Caller Phone:** Not reported
- **Notifier Name:** Not reported
- **Notifier Phone:** Not reported
- **Spiller:** UNKNOWN
- **Spiller Address:** Not reported
- **Spill Class:** Known release that creates potential for fire or hazard. DEC Response: Willing Responsible Party. Corrective action taken.
- **Spill Closed D T:** 05/07/1997
- **Resource Affected:** Surface Water
- **Spill Source:** Unknown
- **PBS Number:** Not reported
- **Reported to Dept:** 05/07/1997 09:49

### Additional Information
- **Recommended Penalty:** Penalty Not Recommended
- **Enforcement Date:** Not reported
- **Investigation Complete:** Not reported
- **UST Involvement:** False
- **Spill Record Last Update:** 05/20/1997
- **Is Updated:** False

### Material
- **Material Class Type:** 1
- **Quantity Spilled:** 0
- **Units:** Gallons
- **Unknown Qty Spilled:** No
- **Quantity Recovered:** 0
- **Unknown Qty Recovered:** False
- **Material:** UNKNOWN PETROLEUM
- **Class Type:** Petroleum
- **Chem Abstract Service Number:** UNKNOWN PETROLEUM
- **Last Date:** 09/29/1994
- **Num Times Material Entry In File:** 16414

### Remarks
- coast guard has a team on the way to check

**DEC Remarks:** 05/07/97 CONFIRMED WITH COAST GUARD; ROAD RUN OFF; UNRECOVERABLE
This is the most recent NY SPILLS record for this site. The NY SPILLS database contains 4 additional records for this site. Please contact your EDR Account Executive for more information.

CONSOLIDATED EDISON - ECHO AVE. SITE (Continued)

Remediation Proposed: Not reported
Remediation Active: Not reported
Remediation Design: Not reported
Remediation Type: Not reported
Quantity: unknown
NPL Status: ...  
Hazardous Waste: PCBs (8007)
Site Description: The site, approximately 150 feet x 600 feet in size, was originally owned by Westchester Lighting Co. and subsequently was acquired by Consolidated Edison in the early 1980’s. Con Ed operated an electrical distribution substation at this site until 1981, when the substation was closed. The site is bounded by a fuel oil dealer, a tidal creek, Echo Bay (Long Island Sound), and private residences. The site includes substation buildings and a transformer yard. PCBs have been found in soils and catch basin sediments, and on surfaces within structures. Con Ed has completed initial clean-up. Subsequent sampling showed PCB levels as high as 50 ppm remaining. A Preliminary Site Assessment (PSA) was conducted pursuant to a consent order. The results showed areas of site soils to be contaminated with PCBs above the cleanup goals of 1 ppm. These soils were removed from the site. Additional sampling of both on-site and off-site soils and sediment were conducted between 1995 & 1998. One sample showed high levels of PCBs in soils greater than 1900 ppm. Echo Bay sediments showed one area at 220 ppm. All site buildings and structures were removed in August of 1995. As of February 1998, 600 tons of PCB contaminated soil was removed from on and off site, including four residential yards. Removal of on-site concrete slabs and soil sampling of those soils under each slab has been completed and small quantities of PCB contaminated soils and sediments in unmapped buried trenches were removed. Backfilling with clean soil in parts of the site was completed. One final area of the site will be excavated and backfilled with clean soil in 2002. An exposure assessment and a fish and wildlife impact analysis for the off-site mudflat area are in progress.

Environmental Problems: On site soil and sediment contain PCBs. Echo Bay sediments contain significant levels of PCB. The back yards of private residences were found to be contaminated with PCBs at levels from 1.1 to 5.6 ppm. The site is immediately adjacent to residential and commercial properties and extends to the Echo Bay tidal lands. Access to the site is restricted by chain link fencing. PCBs had been found at elevated levels in the former substation building and surrounding soil. Cleanup of PCBs is nearing completion and the majority of the site has been covered with clean fill. Final remedial activities should be completed in 2002. Soil sampling conducted at adjacent residential properties found PCBs in four yards above the cleanup guideline of 1 ppm per million. The PCB contaminated soils in the yards were excavated and removed. There are no known drinking water supply wells in the vicinity.

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA’s Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

**CERCLIS:** Comprehensive Environmental Response, Compensation, and Liability Information System  
Source: EPA  
Telephone: 703-413-0223

CERCLIS contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies, and private persons pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). CERCLIS contains sites which are either proposed to or on the National Priorities List (NPL) and sites which are in the screening and assessment phase for possible inclusion on the NPL.

**CERCLIS-NFRAP:** CERCLIS No Further Remedial Action Planned  
Source: EPA  
Telephone: 703-413-0223

As of February 1995, CERCLIS sites designated "No Further Remedial Action Planned" (NFRAP) have been removed from CERCLIS. NFRAP sites may be sites where, following an initial investigation, no contamination was found, contamination was removed quickly without the need for the site to be placed on the NPL, or the contamination was not serious enough to require Federal Superfund action or NPL consideration. EPA has removed approximately 25,000 NFRAP sites to lift the unintended barriers to the redevelopment of these properties and has archived them as historical records so EPA does not needlessly repeat the investigations in the future. This policy change is part of the EPA’s Brownfields Redevelopment Program to help cities, states, private investors and affected citizens to promote economic redevelopment of unproductive urban sites.
CORRACTS: Corrective Action Report
Source: EPA
Telephone: 800-424-9346
CORRACTS identifies hazardous waste handlers with RCRA corrective action activity.

Date of Government Version: 09/29/02
Date Made Active at EDR: 12/26/02
Database Release Frequency: Semi-Annually

RCRIS: Resource Conservation and Recovery Information System
Source: EPA/NTIS
Telephone: 800-424-9346
Resource Conservation and Recovery Information System. RCRIS includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA).

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.
Oil/Gas Pipelines/Electrical Transmission Lines: This data was obtained by EDR from the USGS in 1994. It is referred to by USGS as GeoData Digital Line Graphs from 1:100,000-Scale Maps. It was extracted from the transportation category including some oil, but primarily gas pipelines and electrical transmission lines.

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

Flood Zone Data: This data, available in select counties across the country, was obtained by EDR in 1999 from the Federal Emergency Management Agency (FEMA). Data depicts 100-year and 500-year flood zones as defined by FEMA.

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002 from the U.S. Fish and Wildlife Service.

GEOCHECK®- PHYSICAL SETTING SOURCE ADDENDUM

TARGET PROPERTY ADDRESS

MANCUSO MARINA
HUNTINGTON PL.
NEW ROCHELLE, NY 10801

TARGET PROPERTY COORDINATES

Latitude (North): 40.912601 - 40° 54' 45.4"
Longitude (West): 73.773499 - 73° 46' 24.6"
Universal Tranverse Mercator: Zone 18
UTM X (Meters): 603290.6
UTM Y (Meters): 4529567.0

EDR's GeoCheck Physical Setting Source Addendum has been developed to assist the environmental professional with the collection of physical setting source information in accordance with ASTM 1527-00, Section 7.2.3. Section 7.2.3 requires that a current USGS 7.5 Minute Topographic Map (or equivalent, such as the USGS Digital Elevation Model) be reviewed. It also requires that one or more additional physical setting sources be sought when (1) conditions have been identified in which hazardous substances or petroleum products are likely to migrate to or from the property, and (2) more information than is provided in the current USGS 7.5 Minute Topographic Map (or equivalent) is generally obtained, pursuant to local good commercial or customary practice, to assess the impact of migration of recognized environmental conditions in connection with the property. Such additional physical setting sources generally include information about the topographic, hydrologic, hydrogeologic, and geologic characteristics of a site, and wells in the area.

Assessment of the impact of contaminant migration generally has two principle investigative components:

1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata. EDR's GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.
GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION
Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).

TOPOGRAPHIC INFORMATION
Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

USGS TOPOGRAPHIC MAP ASSOCIATED WITH THIS SITE
Target Property: 2440073-H7 MOUNT VERNON, NY
Source: USGS 7.5 min quad index

GENERAL TOPOGRAPHIC GRADIENT AT TARGET PROPERTY
Target Property: General ESE
Source: General Topographic Gradient has been determined from the USGS 1 Degree Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

HYDROLOGIC INFORMATION
Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

FEMA FLOOD ZONE
Target Property County: WESTCHESTER, NY
FEMA Flood Electronic Data: YES - refer to the Overview Map and Detail Map
Flood Plain Panel at Target Property: 3609220006C
Additional Panels in search area: 3609170003B 3609150001B 3609220007C 3609220006C 3609220009C

NATIONAL WETLAND INVENTORY
NWI Quad at Target Property: MOUNT VERNON
NWI Electronic Data Coverage: YES - refer to the Overview Map and Detail Map

HYDROGEOLOGIC INFORMATION
Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.
Site-Specific Hydrogeological Data:
Search Radius: 2.0 miles
Status: Not found

AQUIFLOW®

Search Radius: 2,000 Miles.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps. The following information is based on Soil Conservation Service STATSGO data.

©1995 Site-specific hydrogeological data gathered by CERCLIS Alerts, Inc., Bainbridge Island, WA. All rights reserved. All of the information and opinions presented are those of the cited EPA report(s), which were completed under a Comprehensive Environmental Response Compensation and Liability Information System (CERCLIS) investigation.
GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

Soil Component Name: URBAN LAND
Soil Surface Texture: variable
Hydrologic Group: Not reported
Soil Drainage Class: Not reported

Hydric Status: Soil does not meet the requirements for a hydric soil.
Corrosion Potential - Uncoated Steel: Not Reported
Depth to Bedrock Min: > 10 inches
Depth to Bedrock Max: > 10 inches

</tbody>
</table>

OTHER SOIL TYPES IN AREA

Based on Soil Conservation Service STATSGO data, the following additional subordinant soil types may appear within the general area of target property.

Soil Surface Textures: fine sandy loam
Surficial Soil Types: fine sandy loam
Shallow Soil Types: No Other Soil Types
Deeper Soil Types: unweathered bedrock stratified gravelly - fine sandy loam fine sandy loam

ADDITIONAL ENVIRONMENTAL RECORD SOURCES

According to ASTM E 1527-00, Section 7.2.2, "one or more additional state or local sources of environmental records may be checked, in the discretion of the environmental professional, to enhance and supplement federal and state sources. Factors to consider in determining which local or additional state records, if any, should be checked include (1) whether they are reasonably ascertainable, (2) whether they are sufficiently useful, accurate, and complete in light of the objective of the records review (see 7.1.1), and (3) whether they are obtained, pursuant to local, good commercial or customary practice." One of the record sources listed in Section 7.2.2 is water well information. Water well information can be used to assist the environmental professional in assessing sources that may impact groundwater flow direction, and in forming an opinion about the impact of contaminant migration on nearby drinking water wells.

PHYSICAL SETTING SOURCE RECORDS SEARCHED

HYDROLOGIC INFORMATION

Flood Zone Data: This data, available in select counties across the country, was obtained by EDR in 1999 from the Federal Emergency Management Agency (FEMA). Data depicts 100-year and 500-year flood zones as defined by FEMA.

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002 from the U.S. Fish and Wildlife Service.

HYDROGEOLOGIC INFORMATION

AQUIFLOW® Information System
Source: EDR proprietary database of groundwater flow information
EDR has developed the AQUIFLOW Information System (AIS) to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted to regulatory authorities at select sites and has extracted the date of the report, hydrogeologically determined groundwater flow direction and depth to water table information.

GEOLOGIC INFORMATION

Geologic Age and Rock Stratigraphic Unit

STATSGO: State Soil Geographic Database
The U.S. Department of Agriculture’s (USDA) Soil Conservation Service (SCS) leads the national Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

ADDITIONAL ENVIRONMENTAL RECORD SOURCES

FEDERAL WATER WELLS

PWS: Public Water Systems
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Public Water System data from the Federal Reporting Data System. A PWS is any water system which provides water to at least 25 people for at least 60 days annually. PWSs provide water from wells, rivers and other sources.

PWS ENF: Public Water Systems Violation and Enforcement Data
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750

USGS Water Wells: In November 1971 the United States Geological Survey (USGS) implemented a national water resource information tracking system. This database contains descriptive information on sites where the USGS collects or has collected data on surface water and/or groundwater. The groundwater data includes information on more than 900,000 wells, springs, and other sources of groundwater.
STATE RECORDS

New York Public Water Wells
Source: New York Department of Health
Telephone: 518-456-6731

New York Facility and Manifest Data
Source: NYSDEC
Telephone: 518-457-6585
Facility and manifest data. Manifest is a document that lists and tracks hazardous waste from the generator through transporters to a tisd facility.

RADON

New York Radon Basement Screening Results
Source: New York Department of Health
Telephone: 518-402-7556

Area Radon Information
Source: USGS
Telephone: 303-202-4210
The National Radon Database has been developed by the U.S. Environmental Protection Agency (USEPA) and is a compilation of the EPA/State Residential Radon Survey and the National Residential Radon Survey. The study covers the years 1986 - 1992. Where necessary data has been supplemented by information collected at private sources such as universities and research institutions.

EPA Radon Zones
Source: EPA
Telephone: 202-564-9370
Sections 307 & 309 of IRAA directed EPA to list and identify areas of U.S. with the potential for elevated indoor radon levels.

TABLE OF CONTENTS

The EDR-Site Report™ is a comprehensive presentation of government filings on a facility identified in a search of over 4 million government records from more than 600 federal, state and local environmental databases. The report is divided into three sections:

Section 1: Facility Summary ............................................................... Page 3
Summary of facility filings including a review of the following areas: waste management, waste disposal, multi-media issues, and Superfund liability.

Section 2: Facility Detail Reports .................................................. Page 4
All available detailed information from databases where sites are identified.

Section 3: Databases Searched and Update Information .................. Page 5
Name, source, update dates, contact phone number and description of each of the databases searched for this report.

Thank you for your business.
Please contact EDR at 1-800-352-0050 with any questions or comments.

SECTION 3: DATABASES SEARCHED AND UPDATE DATES

To maintain currency of the following federal, state and local databases, EDR contacts the appropriate government agency on a monthly or quarterly basis as required.

Elapsed ASTM days: Provides confirmation that this report meets or exceeds the 90-day updating requirement of the ASTM standard.

WASTE MANAGEMENT

RCRIS: Resource Conservation and Recovery Information System
Source: EPA/NTIS
Telephone: 800-424-9346

Resource Conservation and Recovery Information System. RCRIS includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA).

Date of Government Version: 09/09/2002
Database Release Frequency: Varies
Date of Last EDR Contact: 12/26/2002
Date of Next Scheduled Update: 03/24/2003

BRS: Biennial Reporting System
Source: EPA/NTIS
Telephone: 800-424-9346

The Biennial Reporting System is a national system administered by the EPA that collects data on the generation and management of hazardous waste. BRS captures detailed data from two groups: Large Quantity Generators (LQG) and Treatment, Storage, and Disposal Facilities.

Date of Government Version: 12/31/1999
Database Release Frequency: Biennially
Date of Last EDR Contact: 12/17/2002
Date of Next Scheduled Update: 03/17/2003

RAATS: RCRA Administrative Action Tracking System
Source: EPA
Telephone: 202-564-4104

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

Date of Government Version: 04/17/1995
Database Release Frequency: No Update Planned
Date of Last EDR Contact: 12/10/2002
Date of Next Scheduled Update: 03/10/2003

CORRACTS: Corrective Action Report
Source: EPA
Telephone: 800-424-9346

CORRACTS identifies hazardous waste handlers with RCRA corrective action activity.

Date of Government Version: 01/15/2003
Database Release Frequency: Semi-Annually
Date of Last EDR Contact: 12/09/2002
Date of Next Scheduled Update: 03/10/2003

PADS: PCB Activity Database System
Source: EPA
Telephone: 202-564-3887

PCB Activity Database. PADS Identifies generators, transporters, commercial stokers and/or brokers and disposers of PCB's who are required to notify the EPA of such activities.

Date of Government Version: 09/20/2002
Database Release Frequency: Annually
Date of Last EDR Contact: 02/10/2003

WASTE DISPOSAL

NPL: National Priority List
Source: EPA
Telephone: Not reported
The National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

CERCLIS: Comprehensive Environmental Response, Compensation, and Liability Information System
Source: EPA
Telephone: 703-413-0223
CERCLIS contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies, and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). CERCLIS contains sites which are either proposed for or on the National Priorities List (NPL) and sites which are in the screening and assessment phase for possible inclusion on the NPL.

Date of Government Version: 12/13/2002
Date Made Active at EDR: 01/15/2003
Database Release Frequency: Quarterly

Date of Data Arrival at EDR: 12/26/2002
Elapsed ASTM Days: 20
Date of Last EDR Contact: 12/26/2002

CERCLIS-NFRAP: CERCLIS No Further Remedial Action Planned
Source: EPA
Telephone: 703-413-0223
As of February 1995, CERCLIS sites designated "No Further Remedial Action Planned" (NFRAP) have been removed from CERCLIS. NFRAP sites may be sites where, following an initial investigation, no contamination was found, contamination was removed quickly without the need for the site to be placed on the NPL, or the contamination was not serious enough to require Federal Superfund action or NPL consideration. EPA has removed approximately 25,000 NFRAP sites to lift the unintended barriers to the redevelopment of these properties and has archived them as historical records so EPA does not needlessly repeat the investigations in the future. This policy change is part of the EPA's Brownfields Redevelopment Program to help cities, states, private investors, and affected citizens to promote economic redevelopment of unproductive urban sites.

Date of Government Version: 12/13/2002
Date of Last EDR Contact: 12/26/2002
Database Release Frequency: Quarterly

NPL LIENS: Federal Superfund Liens
Source: EPA
Telephone: 205-564-4267
Federal Superfund Liens. Under the authority granted the USEPA by the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner receives notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

Date of Government Version: 10/15/1991
Date Made Active at EDR: 03/30/1994
Database Release Frequency: No Update Planned

Date of Data Arrival at EDR: 02/02/1994
Elapsed ASTM Days: 56
Date of Last EDR Contact: 02/27/2003

NY SHWS: Inactive Hazardous Waste Disposal Sites in New York State
Source: Department of Environmental Conservation
Telephone: 518-402-9553
State Hazardous Waste Sites. State hazardous waste site records are the states' equivalent to CERCLIS. These sites may or may not already be listed on the federal CERCLIS list. Priority sites planned for cleanup using state funds (state equivalent of Superfund) are identified along with sites where cleanup will be paid for by potentially responsible parties. Available information varies by state.

Date of Government Version: 04/01/2002
Database Release Frequency: Annually

Date of Last EDR Contact: 02/24/2003

# TABLE OF CONTENTS

The EDR-Site Report™ is a comprehensive presentation of government filings on a facility identified in a search of over 4 million government records from more than 600 federal, state and local environmental databases. The report is divided into three sections:

**Section 1: Facility Summary ................................................................. Page 3**

Summary of facility filings including a review of the following areas: waste management, waste disposal, multi-media issues, and Superfund liability.

**Section 2: Facility Detail Reports ........................................................ Page 4**

All available detailed information from databases where sites are identified.

**Section 3: Databases Searched and Update Information ................................ Page 5**

Name, source, update dates, contact phone number and description of each of the databases searched for this report.

*Thank you for your business.*

Please contact EDR at 1-800-352-0050 with any questions or comments.

SECTION 3: DATABASES SEARCHED AND UPDATE DATES

To maintain currency of the following federal, state and local databases, EDR contacts the appropriate government agency on a monthly or quarterly basis as required.

*Elapsed ASTM days:* Provides confirmation that this report meets or exceeds the 90-day updating requirement of the ASTM standard.

**WASTE MANAGEMENT**

**RCRIS:** Resource Conservation and Recovery Information System
Source: EPA/NTIS
Telephone: 800-242-9346
Resource Conservation and Recovery Information System. RCRIS includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA).

Date of Government Version: 09/09/2002
Database Release Frequency: Varies

Date of Last EDR Contact: 12/28/2002
Date of Next Scheduled Update: 03/24/2003

**BRS:** Biennial Reporting System
Source: EPA/NTIS
Telephone: 800-242-9346
The Biennial Reporting System is a national system administered by the EPA that collects data on the generation and management of hazardous waste. BRS captures detailed data from two groups: Large Quantity Generators (LQG) and Treatment, Storage, and Disposal Facilities.

Date of Government Version: 12/31/1999
Database Release Frequency: Biennially

Date of Last EDR Contact: 12/17/2002
Date of Next Scheduled Update: 03/17/2003

**RAATS:** RCRA Administrative Action Tracking System
Source: EPA
Telephone: 202-564-4104
RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administrative actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

Date of Government Version: 04/17/1995
Database Release Frequency: No Update Planned

Date of Last EDR Contact: 12/10/2002
Date of Next Scheduled Update: 03/10/2003

**CORRACTS:** Corrective Action Report
Source: EPA
Telephone: 800-242-9346
CORRACTS identifies hazardous waste handlers with RCRA corrective action activity.

Date of Government Version: 01/15/2003
Database Release Frequency: Semi-Annually

Date of Last EDR Contact: 12/09/2002
Date of Next Scheduled Update: 03/10/2003

**PADS:** PCB Activity Database System
Source: EPA
Telephone: 202-564-3887
PCB Activity Database. PADS identifies generators, transporters, commercial stokers and/or brokers and disposers of PCB's who are required to notify the EPA of such activities.

Date of Government Version: 09/20/2002
Database Release Frequency: Annually

Date of Last EDR Contact: 02/10/2003
Date of Next Scheduled Update: 05/12/2003

**MLTS:** Material Licensing Tracking System
Source: Nuclear Regulatory Commission
Telephone: 301-415-7169
MLTS is maintained by the Nuclear Regulatory Commission and contains a list of approximately 8,100 sites which possess or use radioactive materials and which are subject to NRC licensing requirements. To maintain currency, EDR contacts the Agency on a quarterly basis.

Date of Government Version: 01/16/2003
Database Release Frequency: Quarterly

Date of Last EDR Contact: 01/06/2003
Date of Next Scheduled Update: 04/07/2003
SECTION 3: DATABASES SEARCHED AND UPDATE DATES

NY AST: Petroleum Bulk Storage
Source: Department of Environmental Conservation
Telephone: 518-402-9549
Registered Aboveground Storage Tanks.
Date of Government Version: 01/01/2002
Database Release Frequency: Varies
Date of Last EDR Contact: 01/28/2003
Date of Next Scheduled Update: 04/29/2003

NY UST: Petroleum Bulk Storage (PBS) Database
Source: Department of Environmental Conservation
Telephone: 518-402-9549
Facilities that have petroleum storage capacities in excess of 1,100 gallons and less than 400,000
gallons.
Date of Government Version: 01/01/2002
Database Release Frequency: Varies
Date of Last EDR Contact: 01/28/2003
Date of Next Scheduled Update: 04/28/2003

ERNS: Emergency Response Notification System
Source: National Response Center, United States Coast Guard
Telephone: 202-260-2342
Emergency Response Notification System. ERNS records and stores information on reported releases of
oil and hazardous substances.
Date of Government Version: 12/31/2001
Database Release Frequency: Annually
Date of Last EDR Contact: 01/27/2003
Date of Next Scheduled Update: 04/28/2003

HMIRS: Hazardous Materials Information Reporting System
Source: U.S. Department of Transportation
Telephone: 202-366-4555
HMIRS contains hazardous material spill incidents reported to DOT.
Date of Government Version: 11/30/2002
Database Release Frequency: Annually
Date of Last EDR Contact: 01/23/2003
Date of Next Scheduled Update: 04/21/2003

WASTE DISPOSAL

NPL: National Priority List
Source: EPA
Telephone: Not reported
National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites
for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As
such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental
Photographic Interpretation Center (EPIC) and regional EPA offices.
Date of Government Version: 01/29/2003
Date Made Active at EDR: 03/04/2003
Database Release Frequency: Semi-Annually
Date of Data Arrival at EDR: 02/04/2003
Elapsed ASTM Days: 28
Date of Last EDR Contact: 02/04/2003

PROPOSED NPL: Proposed National Priority List Sites
Source: EPA
Telephone: Not reported
Date of Government Version: 01/29/2003
Date Made Active at EDR: 03/04/2003
Database Release Frequency: Semi-Annually
Date of Data Arrival at EDR: 02/04/2003
Elapsed ASTM Days: 28
Date of Last EDR Contact: 02/04/2003

DELISTED NPL: National Priority List Deletions
Source: EPA
Telephone: Not reported
The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria
that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425(e), sites may
be deleted from the NPL where no further response is appropriate.
Date of Government Version: 01/29/2003
Date Made Active at EDR: 03/04/2003
Database Release Frequency: Quarterly
Date of Data Arrival at EDR: 02/04/2003
Date of Last EDR Contact: 02/04/2003
SECTION 3: DATABASES SEARCHED AND UPDATE DATES

...Continued...

CERCLIS: Comprehensive Environmental Response, Compensation, and Liability Information System
Source: EPA
Telephone: 703-413-0223
CERCLIS contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). CERCLIS contains sites which are either proposed to or on the National Priorities List (NPL) and sites which are in the screening and assessment phase for possible inclusion on the NPL.

Date of Government Version: 12/13/2002
Date Made Active at EDR: 01/15/2003
Database Release Frequency: Quarterly
Date of Data Arrival at EDR: 12/26/2002
Elapsed ATM Days: 20
Date of Last EDR Contact: 12/26/2002

CERCLIS-NFRAP: CERCLIS No Further Remedial Action Planned
Source: EPA
Telephone: 703-413-0223
As of February 1995, CERCLIS sites designated "No Further Remedial Action Planned" (NFRAP) have been removed from CERCLIS. NFRAP sites may be sites where, following an initial investigation, no contamination was found, contamination was removed quickly without the need for the site to be placed on the NPL, or the contamination was not serious enough to require Federal Superfund action or NPL consideration. EPA has removed approximately 25,000 NFRAP sites to lift the unintended barriers to the redevelopment of these properties and has archived them as historical records so EPA does not needlessly repeat the investigations in the future. This policy change is part of the EPA's Brownfields Redevelopment Program to help cities, states, private investors and affected citizens to promote economic redevelopment of unproductive urban sites.

Date of Government Version: 12/13/2002
Date of Last EDR Contact: 12/26/2002
Database Release Frequency: Quarterly
Date of Next Scheduled Update: 03/24/2003

NPL LIENS: Federal Superfund Liens
Source: EPA
Telephone: 205-594-4267
Federal Superfund Liens. Under the authority granted the USEPA by the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner receives notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

Date of Government Version: 10/15/1991
Date Made Active at EDR: 03/30/1994
Database Release Frequency: No Update Planned
Date of Data Arrival at EDR: 02/02/1994
Elapsed ATM Days: 56
Date of Last EDR Contact: 02/27/2003

NY SHWS: Inactive Hazardous Waste Disposal Sites in New York State
Source: Department of Environmental Conservation
Telephone: 518-402-9553
State Hazardous Waste Sites. State hazardous waste site records are the states' equivalent to CERCLIS. These sites may or may not already be listed on the federal CERCLIS list. Priority sites planned for cleanup using state funds (state equivalent of Superfund) are identified along with sites where cleanup will be paid for by potentially responsible parties. Available information varies by state.

Date of Government Version: 04/01/2002
Database Release Frequency: Annually
Date of Last EDR Contact: 02/24/2003
Date of Next Scheduled Update: 05/26/2003

NY SWF/LF: Facility Register
Source: Department of Environmental Conservation
Telephone: 518-487-2051
Solid Waste Facilities/Landfill Sites. SWF/LF type records typically contain an inventory of solid waste disposal facilities or landfills in a particular state. Depending on the state, these may be active or inactive facilities or open dumps that failed to meet RCRA Subtitle D Section 4004 criteria for solid waste landfills or disposal sites.

Date of Government Version: 12/31/2001
Database Release Frequency: Semi-Annually
Date of Last EDR Contact: 02/03/2003
Date of Next Scheduled Update: 05/05/2003

MULTIMEDIA

TRIS: Toxic Chemical Release Inventory System
Source: EPA
Telephone: 202-280-1531
Toxic Release Inventory System. TRIS identifies facilities which release toxic chemicals to the air, water and land in reportable quantities under SARA Title III Section 313.
Date of Government Version: 12/31/2000
Database Release Frequency: Annually
Date of Last EDR Contact: 12/26/2002
Date of Next Scheduled Update: 03/24/2003

SSTS: Section 7 Tracking Systems
Source: EPA
Telephone: 202-564-5008
Section 7 of the Federal Insecticide, Fungicide and Rodenticide Act, as amended (92 Stat. 629) requires all registered pesticide-producing establishments to submit a report to the Environmental Protection Agency by March 1st each year. Each establishment must report the types and amounts of pesticides, active ingredients and devices being produced, and those having been produced and sold or distributed in the past year.
Date of Government Version: 12/31/2000
Database Release Frequency: Annually
Date of Last EDR Contact: 01/21/2003
Date of Next Scheduled Update: 04/21/2003

TSCA: Toxic Substances Control Act
Source: EPA
Telephone: 202-260-5521
Toxic Substances Control Act. TSCA identifies manufacturers and importers of chemical substances included on the TSCA Chemical Substance Inventory list. It includes data on the production volume of these substances by plant site.
Date of Government Version: 12/31/1998
Database Release Frequency: N/A
Date of Last EDR Contact: 12/10/2002
Date of Next Scheduled Update: 03/10/2003

FTTS: FIFRA/TSCA Tracking System - FIFRA (Federal Insecticide, Fungicide, & Rodenticide Act)/TSCA (Toxic Substances Control Act)
Source: EPA/Office of Prevention, Pesticides and Toxic Substances
Telephone: 202-564-2501
FTTS tracks administrative cases and pesticide enforcement actions and compliance activities related to FIFRA, TSCA and EPCRA (Emergency Planning and Community Right-to-Know Act). To maintain currency, EDR contacts the Agency on a quarterly basis.
Date of Government Version: 10/24/2002
Database Release Frequency: Quarterly
Date of Last EDR Contact: 12/26/2002
Date of Next Scheduled Update: 03/24/2003

TABLE OF CONTENTS

The EDR-Site Report™ is a comprehensive presentation of government filings on a facility identified in a search of over 4 million government records from more than 600 federal, state and local environmental databases. The report is divided into three sections:

Section 1: Facility Summary ................................................................. Page 3

Summary of facility filings including a review of the following areas: waste management, waste disposal, multi-media issues, and Superfund liability.

Section 2: Facility Detail Reports ....................................................... Page 4

All available detailed information from databases where sites are identified.

Section 3: Databases Searched and Update Information. ................ Page 5

Name, source, update dates, contact phone number and description of each of the databases searched for this report.

Thank you for your business.
Please contact EDR at 1-800-352-0050
with any questions or comments.

SECTION 3: DATABASES SEARCHED AND UPDATE DATES

To maintain currency of the following federal, state and local databases, EDR contacts the appropriate government agency on a monthly or quarterly basis as required.

**Elapsed ASTM days**: Provides confirmation that this report meets or exceeds the 90-day updating requirement of the ASTM standard.

**WASTE MANAGEMENT**

**RCRIS**: Resource Conservation and Recovery Information System

Source: EPANTIS

Telephone: 800-424-9346

Resource Conservation and Recovery Information System. RCRIS includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA).

- Date of Government Version: 09/09/2002
- Database Release Frequency: Varies
- Date of Last EDR Contact: 12/26/2002
- Date of Next Scheduled Update: 03/24/2003

**BRS**: Biennial Reporting System

Source: EPANTIS

Telephone: 800-424-8346

The Biennial Reporting System is a national system administered by the EPA that collects data on the generation and management of hazardous waste. BRS captures detailed data from two groups: Large Quantity Generators (LQG) and Treatment, Storage, and Disposal Facilities.

- Date of Government Version: 12/31/1999
- Database Release Frequency: Biennially
- Date of Last EDR Contact: 12/17/2002
- Date of Next Scheduled Update: 03/17/2003

**RAATS**: RCRA Administrative Action Tracking System

Source: EPA

Telephone: 202-564-4104

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. RCRA enforcement actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

- Date of Government Version: 04/17/1995
- Database Release Frequency: No Update Planned
- Date of Last EDR Contact: 12/10/2002
- Date of Next Scheduled Update: 03/10/2003

**CORRACTS**: Corrective Action Report

Source: EPA

Telephone: 800-424-9346

CORRACTS identifies hazardous waste handlers with RCRA corrective action activity.

- Date of Government Version: 01/15/2003
- Database Release Frequency: Semi-Annually
- Date of Last EDR Contact: 12/09/2002
- Date of Next Scheduled Update: 03/10/2003

**PADS**: PCB Activity Database System

Source: EPA

Telephone: 202-564-3887

PCB Activity Database. PADS identifies generators, transporters, commercial storers and/or brokers and disposers of PCB's who are required to notify the EPA of such activities.

- Date of Government Version: 09/20/2002
- Database Release Frequency: Annually
- Date of Last EDR Contact: 02/10/2003
- Date of Next Scheduled Update: 05/12/2003

**MLTS**: Material Licensing Tracking System

Source: Nuclear Regulatory Commission

Telephone: 301-415-7169

MLTS is maintained by the Nuclear Regulatory Commission and contains a list of approximately 8,100 sites which possess or use radioactive materials and which are subject to NRC licensing requirements. To maintain currency, EDR contacts the Agency on a quarterly basis.

- Date of Government Version: 01/16/2003
- Database Release Frequency: Quarterly
- Date of Last EDR Contact: 01/06/2003
- Date of Next Scheduled Update: 04/07/2003
SECTION 3: DATABASES SEARCHED AND UPDATE DATES

NY AST: Petroleum Bulk Storage
Source: Department of Environmental Conservation
Telephone: 518-402-9549
Registered Aboveground Storage Tanks.

Date of Government Version: 01/01/2002
Database Release Frequency: Varies
Date of Last EDR Contact: 01/28/2003
Date of Next Scheduled Update: 04/28/2003

NY UST: Petroleum Bulk Storage (PBS) Database
Source: Department of Environmental Conservation
Telephone: 518-402-9549
Facilities that have petroleum storage capacities in excess of 1,100 gallons and less than 400,000 gallons.

Date of Government Version: 01/01/2002
Database Release Frequency: Varies
Date of Last EDR Contact: 01/28/2003
Date of Next Scheduled Update: 04/28/2003

ERNs: Emergency Response Notification System
Source: National Response Center, United States Coast Guard
Telephone: 202-260-2342
Emergency Response Notification System. ERNS records and stores information on reported releases of oil and hazardous substances.

Date of Government Version: 12/31/2001
Database Release Frequency: Annually
Date of Last EDR Contact: 01/27/2003
Date of Next Scheduled Update: 04/28/2003

HMIRS: Hazardous Materials Information Reporting System
Source: U.S. Department of Transportation
Telephone: 202-366-4555
Hazardous Materials Incident Report System. HMIRS contains hazardous material spill incidents reported to DOT.

Date of Government Version: 11/30/2002
Database Release Frequency: Annually
Date of Last EDR Contact: 01/23/2003
Date of Next Scheduled Update: 04/21/2003

WASTE DISPOSAL

NPL: National Priority List
Source: EPA
Telephone: Not reported
National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Date of Government Version: 01/29/2003
Date Made Active at EDR: 03/04/2003
Database Release Frequency: Semi-Annually
Date of Data Arrival at EDR: 02/04/2003
Elapsed ASTM Days: 28
Date of Last EDR Contact: 02/04/2003

PROPOSED NPL: Proposed National Priority List Sites
Source: EPA
Telephone: Not reported

Date of Government Version: 01/29/2003
Date Made Active at EDR: 03/04/2003
Database Release Frequency: Semi-Annually
Date of Data Arrival at EDR: 02/04/2003
Elapsed ASTM Days: 28
Date of Last EDR Contact: 02/04/2003

DELISTED NPL: National Priority List Deletions
Source: EPA
Telephone: Not reported
The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425(e), sites may be deleted from the NPL where no further response is appropriate.

Date of Government Version: 01/29/2003
Date Made Active at EDR: 03/04/2003
Database Release Frequency: Quarterly
Date of Data Arrival at EDR: 02/04/2003
Elapsed ASTM Days: 28
Date of Last EDR Contact: 02/04/2003
SECTION 3: DATABASES SEARCHED AND UPDATE DATES

CERCLIS: Comprehensive Environmental Response, Compensation, and Liability Information System
Source: EPA
Telephone: 703-413-0223
CERCLIS contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). CERCLIS contains sites which are either proposed to or on the National Priorities List (NPL) and sites which are in the screening and assessment phase for possible inclusion on the NPL.

Date of Government Version: 12/13/2002
Date Made Active at EDR: 01/15/2003
Database Release Frequency: Quarterly
Date of Data Arrival at EDR: 12/28/2002
Elapsed ASTM Days: 20
Date of Last EDR Contact: 12/28/2002

CERCLIS-NFRAP: CERCLIS No Further Remedial Action Planned
Source: EPA
Telephone: 703-413-0223
As of February 1995, CERCLIS sites designated "No Further Remedial Action Planned" (NFRAP) have been removed from CERCLIS. NFRAP sites may be sites where, following an initial investigation, no contamination was found, contamination was removed quickly without the need for the site to be placed on the NPL, or the contamination was not serious enough to require Federal Superfund action or NPL consideration.
EPA has removed approximately 25,000 NFRAP sites to lift the unintended barriers to the redevelopment of these properties and has archived them as historical records so EPA does not needlessly repeat the investigations in the future. This policy change is part of the EPA’s Brownfields Redevelopment Program to help cities, states, private investors and affected citizens to promote economic redevelopment of unproductive urban sites.

Date of Government Version: 12/13/2002
Date Made Active at EDR: 03/30/1994
Database Release Frequency: Quarterly
Date of Last EDR Contact: 12/28/2002
Date of Next Scheduled Update: 03/24/2003

NPL LIENS: Federal Superfund Liens
Source: EPA
Telephone: 205-564-4267
Federal Superfund Liens. Under the authority granted the USEPA by the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner receives notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

Date of Government Version: 10/15/1991
Date Made Active at EDR: 03/30/1994
Database Release Frequency: No Update Planned
Date of Data Arrival at EDR: 02/02/1994
Elapsed ASTM Days: 56
Date of Last EDR Contact: 02/27/2003

NY SHWS: Inactive Hazardous Waste Disposal Sites in New York State
Source: Department of Environmental Conservation
Telephone: 518-402-9553
State Hazardous Waste Sites. State hazardous waste site records are the states' equivalent to CERCLIS. These sites may or may not already be listed on the federal CERCLIS list. Priority sites planned for cleanup using state funds (state equivalent of Superfund) are identified along with sites where cleanup will be paid for by potentially responsible parties. Available information varies by state.

Date of Government Version: 04/01/2002
Date Made Active at EDR: 03/30/1994
Database Release Frequency: Annually
Date of Last EDR Contact: 02/24/2003
Date of Next Scheduled Update: 05/26/2003

NY SWF/LF: Facility Register
Source: Department of Environmental Conservation
Telephone: 518-457-2051
Solid Waste Facilities/Landfill Sites. SWF/LF type records typically contain an inventory of solid waste disposal facilities or landfills in a particular state. Depending on the state, these may be active or inactive facilities or open dumps that failed to meet RCRA Subtitle D Section 4004 criteria for solid waste landfills or disposal sites.

Date of Government Version: 12/31/2001
Date Made Active at EDR: 03/30/1994
Database Release Frequency: Semi-Annually
Date of Last EDR Contact: 02/03/2003

TABLE OF CONTENTS

The EDR-Site Report™ is a comprehensive presentation of government filings on a facility identified in a search of over 4 million government records from more than 600 federal, state and local environmental databases. The report is divided into three sections:

Section 1: Facility Summary .......................................................... Page 3
Summary of facility filings including a review of the following areas: waste management, waste disposal, multi-media issues, and Superfund liability.

Section 2: Facility Detail Reports .................................................. Page 4
All available detailed information from databases where sites are identified.

Section 3: Databases Searched and Update Information ....................... Page 5
Name, source, update dates, contact phone number and description of each of the databases searched for this report.

Thank you for your business.
Please contact EDR at 1-800-352-0050
with any questions or comments.

SECTION 3: DATABASES SEARCHED AND UPDATE DATES

To maintain currency of the following federal, state and local databases, EDR contacts the appropriate government agency on a monthly or quarterly basis as required.

Elapsed ASTM days: Provides confirmation that this report meets or exceeds the 90-day updating requirement of the ASTM standard.

WASTE MANAGEMENT

RCRIS: Resource Conservation and Recovery Information System
Source: EPA/NTIS
Telephone: 800-424-9346

Resource Conservation and Recovery Information System. RCRIS includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA).

Date of Government Version: 09/09/2002
Database Release Frequency: Varies

Date of Last EDR Contact: 12/29/2002
Date of Next Scheduled Update: 03/24/2003

BRS: Biennial Reporting System
Source: EPA/NTIS
Telephone: 800-424-9346

The Biennial Reporting System is a national system administered by the EPA that collects data on the generation and management of hazardous waste. BRS captures detailed data from two groups: Large Quantity Generators (LQG) and Treatment, Storage, and Disposal Facilities.

Date of Government Version: 12/31/1999
Database Release Frequency: Biennially

Date of Last EDR Contact: 12/17/2002
Date of Next Scheduled Update: 03/17/2003

RAATS: RCRA Administrative Action Tracking System
Source: EPA
Telephone: 202-564-4104

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

Date of Government Version: 04/17/1995
Database Release Frequency: No Update Planned

Date of Last EDR Contact: 12/10/2002
Date of Next Scheduled Update: 03/10/2003

CORRACTS: Corrective Action Report
Source: EPA
Telephone: 800-424-9346

CORRACTS identifies hazardous waste handlers with RCRA corrective action activity.

Date of Government Version: 01/15/2003
Database Release Frequency: Semi-Annually

Date of Last EDR Contact: 12/09/2002
Date of Next Scheduled Update: 03/10/2003

PADS: PCB Activity Database System
Source: EPA
Telephone: 202-564-3887

PCB Activity Database. PADS identifies generators, transporters, commercial storers and/or brokers and disposers of PCB's who are required to notify the EPA of such activities.

Date of Government Version: 09/20/2002
Database Release Frequency: Annually

Date of Last EDR Contact: 02/10/2003
Date of Next Scheduled Update: 05/12/2003

MLTS: Material Licensing Tracking System
Source: Nuclear Regulatory Commission
Telephone: 301-415-7169

MLTS is maintained by the Nuclear Regulatory Commission and contains a list of approximately 8,100 sites which possess or use radioactive materials and which are subject to NRC licensing requirements. To maintain currency, EDR contacts the Agency on a quarterly basis.

Date of Government Version: 01/16/2003
Database Release Frequency: Quarterly

Date of Last EDR Contact: 01/06/2003
Date of Next Scheduled Update: 04/07/2003
SECTION 3: DATABASES SEARCHED AND UPDATE DATES

...Continued...

NY AST: Petroleum Bulk Storage
Source: Department of Environmental Conservation
Telephone: 518-402-9549
Registered Aboveground Storage Tanks.

Date of Government Version: 01/01/2002
Date of Last EDR Contact: 01/28/2003
Database Release Frequency: Varies
Date of Next Scheduled Update: 04/28/2003

NY UST: Petroleum Bulk Storage (PBS) Database
Source: Department of Environmental Conservation
Telephone: 518-402-9549
Facilities that have petroleum storage capacities in excess of 1,100 gallons and less than 400,000 gallons.

Date of Government Version: 01/01/2002
Date of Last EDR Contact: 01/28/2003
Database Release Frequency: Varies
Date of Next Scheduled Update: 04/28/2003

ERNs: Emergency Response Notification System
Source: National Response Center, United States Coast Guard
Telephone: 202-260-2342
Emergency Response Notification System. ERNS records and stores information on reported releases of oil and hazardous substances.

Date of Government Version: 12/31/2001
Date of Last EDR Contact: 01/27/2003
Database Release Frequency: Annually
Date of Next Scheduled Update: 04/28/2003

HMIRS: Hazardous Materials Information Reporting System
Source: U.S. Department of Transportation
Telephone: 202-366-4555
Hazardous Materials incident Report System. HMIRS contains hazardous material spill incidents reported to DOT.

Date of Government Version: 11/30/2002
Date of Last EDR Contact: 01/23/2003
Database Release Frequency: Annually
Date of Next Scheduled Update: 04/21/2003

WASTE DISPOSAL

NPL: National Priority List
Source: EPA
Telephone: Not reported
National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA’s Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Date of Government Version: 01/29/2003
Date Made Active at EDR: 03/04/2003
Database Release Frequency: Semi-Annually
Date of Data Arrival at EDR: 02/04/2003
Elapsed ASTM Days: 28
Date of Last EDR Contact: 02/04/2003

PROPOSED NPL: Proposed National Priority List Sites
Source: EPA
Telephone: Not reported

Date of Government Version: 01/29/2003
Date Made Active at EDR: 03/04/2003
Database Release Frequency: Semi-Annually
Date of Data Arrival at EDR: 02/04/2003
Elapsed ASTM Days: 28
Date of Last EDR Contact: 02/04/2003

DELISTED NPL: National Priority List Deletions
Source: EPA
Telephone: Not reported
The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425(e), sites may be deleted from the NPL where no further response is appropriate.

Date of Government Version: 01/29/2003
Date Made Active at EDR: 03/04/2003
Database Release Frequency: Quarterly
Date of Data Arrival at EDR: 02/04/2003
Elapsed ASTM Days: 28
Date of Last EDR Contact: 02/04/2003
### SECTION 3: DATABASES SEARCHED AND UPDATE DATES

...Continued...

**CERCLIS:** Comprehensive Environmental Response, Compensation, and Liability Information System  
Source: EPA  
Telephone: 703-413-0223  
CERCLIS contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies, and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). CERCLIS contains sites which are either proposed to be included on the National Priorities List (NPL) and sites which are in the screening and assessment phase for possible inclusion on the NPL.

| Date of Government Version: | 12/13/2002 | Date of Last EDR Contact: | 12/26/2002 |
| Date Made Active at EDR: | 01/15/2003 | Elapsed ASTM Days: | 20 |
| Database Release Frequency: | Quarterly | Date of Last EDR Contact: | 12/26/2002 |

**CERCLIS-NFRAP:** CERCLIS No Further Remedial Action Planned  
Source: EPA  
Telephone: 703-413-0223  
As of February 1995, CERCLIS sites designated "No Further Remedial Action Planned" (NFRAP) have been removed from CERCLIS. NFRAP sites may be sites where, following an initial investigation, no contamination was found, contamination was removed quickly without the need for the site to be placed on the NPL, or the contamination was not serious enough to require Federal Superfund action or NPL consideration. EPA has removed approximately 25,000 NFRAP sites to lift the unintended barriers to the redevelopment of these properties and has archived them as historical records so EPA does not needlessly repeat the investigations in the future. This policy change is part of the EPA's Brownfields Redevelopment Program to help cities, states, private investors, and affected citizens to promote economic redevelopment of unproductive urban sites.

| Date of Government Version: | 12/13/2002 | Date of Last EDR Contact: | 12/26/2002 |
| Database Release Frequency: | Quarterly | Date of Next Scheduled Update: | 03/24/2003 |

**NPL LIENS:** Federal Superfund Liens  
Source: EPA  
Telephone: 205-564-4267  
Federal Superfund Liens. Under the authority granted the USEPA by the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner receives notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

| Date of Government Version: | 10/15/1991 | Date of Last EDR Contact: | 02/26/2003 |
| Date Made Active at EDR: | 03/30/1994 | Elapsed ASTM Days: | 56 |
| Database Release Frequency: | No Update Planned | Date of Last EDR Contact: | 02/27/2003 |

**NY SHWS:** Inactive Hazardous Waste Disposal Sites in New York State  
Source: Department of Environmental Conservation  
Telephone: 518-402-9553  
State Hazardous Waste Sites. State hazardous waste site records are the states' equivalent to CERCLIS. These sites may or may not already be listed on the federal CERCLIS list. Priority sites planned for cleanup using state funds (state equivalent of Superfund) are identified along with sites where cleanup will be paid for by potentially responsible parties. Available information varies by site.

| Date of Government Version: | 04/01/2002 | Date of Last EDR Contact: | 02/24/2003 |
| Database Release Frequency: | Annually | Date of Next Scheduled Update: | 05/26/2003 |

**NY SWF/LF:** Facility Register  
Source: Department of Environmental Conservation  
Telephone: 518-457-2051  
Solid Waste Facilities/Landfill Sites. SWF/LF type records typically contain an inventory of solid waste disposal facilities or landfills in a particular state. Depending on the state, these may be active or inactive facilities or open dumps that failed to meet RCRA Subtitle D Section 4044 criteria for solid waste landfills or disposal sites.

| Date of Government Version: | 12/31/2001 | Date of Last EDR Contact: | 02/03/2003 |
| Database Release Frequency: | Semi-Annually | Date of Next Scheduled Update: | 05/05/2003 |
MULTIMEDIA

TRIS: Toxic Chemical Release Inventory System
Source: EPA
Telephone: 202-260-1531
Toxic Release Inventory System. TRIS identifies facilities which release toxic chemicals to the air, water and land in reportable quantities under SARA Title III Section 313.

Date of Government Version: 12/31/2000
Database Release Frequency: Annually
Date of Last EDR Contact: 12/26/2002
Date of Next Scheduled Update: 03/24/2003

SSTS: Section 7 Tracking Systems
Source: EPA
Telephone: 202-564-5008
Section 7 of the Federal Insecticide, Fungicide and Rodenticide Act, as amended (92 Stat. 829) requires all registered pesticide-producing establishments to submit a report to the Environmental Protection Agency by March 1st each year. Each establishment must report the types and amounts of pesticides, active ingredients and devices being produced, and those having been produced and sold or distributed in the past year.

Date of Government Version: 12/31/2000
Database Release Frequency: Annually
Date of Last EDR Contact: 01/21/2003
Date of Next Scheduled Update: 04/21/2003

TSCA: Toxic Substances Control Act
Source: EPA
Telephone: 202-260-5521
Toxic Substances Control Act. TSCA identifies manufacturers and importers of chemical substances included on the TSCA Chemical Substance Inventory list. It includes data on the production volume of these substances by plant site.

Date of Government Version: 12/31/1998
Database Release Frequency: N/A
Date of Last EDR Contact: 12/10/2002
Date of Next Scheduled Update: 03/10/2003

FINDS: Facility Index System/Facility Identification Initiative Program Summary Report
Source: EPA
Telephone: Not reported
FINDS contains both facility information and 'pointers' to other sources that contain more detail. EDR includes the following FINDS databases in this report: PCS (Permit Compliance System), AIRS (Aerometric Information Retrieval System), DOCKET (Enforcement Docket used to manage and track information on civil and criminal enforcement cases for all environmental statutes), FURS (Federal Underground Injection Control), C-DOCKET (Criminal Docket System used to track criminal enforcement actions for all environmental statutes), FFIS (Federal Facilities Information System), STATE (State Environmental Laws and Statutes), and PADS (PCB Activity Data System).

Date of Government Version: 01/14/2003
Database Release Frequency: Quarterly
Date of Last EDR Contact: 01/06/2003

APPENDIX B

FREEDOM OF INFORMATION ACT RESPONSE LETTERS
Mr. Richard Delahunty
Foster Wheeler Environmental Corporation
1000 The American Road
Morris Plains, NJ 07950

Dear Mr. Delahunty:

This is to acknowledge receipt of your Freedom of Information Law request seeking:

Records re: Mancuso Marina, Huntington Place, New Rochelle

I have referred your request to the following Records Custodian(s) / Freedom of Information Law Coordinator(s) who may possess the records you are requesting:

Ms. Antoinette Norfleet - Environmental Remediation
625 Broadway
Albany, NY 12233-7012 (518) 402-9750

Mr. Michael Knipfing - Region 3
21 South Putt Corners Road
New Paltz, NY 12561-1696 (845) 256-3052

You may expect a response to your request by 3/20/03.

If I can be of further assistance, please contact me at (518) 402-8000 Refer to request number 03-235 if you write or call.

Sincerely,

Ruth L. Earl
Records Access Officer
February 27, 2003

Foster Wheeler Environmental Corporation
1000 The American Road
Morris Plains, NJ 07950
Att: Richard Delahunty

Re: Freedom of Information
Request No. 0112
Brownfields Assessment
Mancuso Marina
Huntington Pl.
New Rochelle, NY 10801

Dear Mr. Delahunty:

This is to acknowledge the receipt of your Freedom of Information request dated February 24, 2003 which was received in this office on February 27, 2003. Your request has been forwarded to the appropriate staff for response; it is anticipated that you will have a response to your request by March 20, 2003.

If you need to communicate with us in the future, please use the “Request Number indicated above. Thank you.

Sincerely,

Mary Landrigan
Freedom of Information Officer

ML/ns
Mr. Richard Delahunt
Foster Wheeler Environmental Corporation
1000 The American Road
Morris Plains, NJ 07950

RE: Freedom of Information Act (FOIA), 5 U.S.C. 552
Request No. 02-RIN-00891-03

Dear Mr. Delahunt:

Thank you for your FOIA request, dated February 24, 2003, and received in this office on February 27, 2003, for records related to MANCUSO MARINA HUNTINGTON PLACE NEW ROCHELLE, NY 10801. The Agency has twenty (20) working days to respond to your request, except when you have agreed to an alternate due date or unusual circumstances exist that would require an extension of time under 5 U.S.C. 552(a)(6)(B). Please be advised that in accordance with the EPA's revised FOIA regulations (40 CFR 2.100, et. seq.), effective November 5, 2002, the Agency's fees for processing requests have changed. The new fee schedule is as follows:

- Clerical staff time billed at $4.00 per 15 minutes of search and/or review
- Professional staff time billed at $7.00 per 15 minutes of search and/or review
- Managers' time billed at $10.25 per 15 minutes of search and/or review
- No fee will be charged for services at or below $14.00
- Assurance of payment of fees above $25.00 will be obtained from the requester before commencing any work
- Advance payment of fees above $250 may be required by the Agency before commencing any work

We hope to respond to you soon. In the interim, please contact us if you have any questions about your request. Please cite your FOIA request number in all communications.

Sincerely,

Freedom of Information Officer - Public Affairs Division
Office: (212)637-3668
Fax: (212)637-5046

SANBORN FIRE INSURANCE MAPS
Sanborn® Map Report

Ship to: Richard Delahunty
Foster Wheeler Environmental
1000 The American Road
Morris Plains, NJ 07950

Order Date: 2/21/2003  Completion Date: 02/24/2003

Inquiry #: 930644.2S
P.O. #: NA

Site Name: Mancuso Marina
Address: Huntington Pl.
City/State: New Rochelle, NY 10801
Cross Streets: Huntington Pl. & Evans Street

1011813BEK  973-630-8000

Based on client-supplied information, fire insurance maps for the following years were identified:

1903 - 1 - map  1993 - 1 - map
1911 - 1 - map  1994 - 1 - map
1931 - 1 - map  1995 - 1 - map
1942 - 1 - map  1996 - 1 - map
1951 - 1 - map
1990 - 1 - map
1991 - 1 - map
1992 - 1 - map

Total Maps: 12

Limited Permission to Photocopy

Foster Wheeler Environmental (the client) is permitted to make up to THREE photocopies of this Sanborn Map transmittal and each fire insurance map accompanying this report solely for the limited use of its customer. No one other than the client is authorized to make copies. Upon request made directly to an EDR Account Executive, the client may be permitted to make a limited number of additional photocopies. This permission is conditioned upon compliance by the client, its customer and their agents with EDR's copyright policy; a copy of which is available upon request.

All maps provided pursuant to a Sanborn® Map Report are currently reproducible of fire insurance maps owned or licensed by Environmental Data Resources, Inc. Resumes of Environmental Professionals Conducting Assessment

We declare that, to best of our professional knowledge and belief, we meet definition of Environmental Professional as defined at Section 312.10 of 40 CFR 312 and that we have the specific qualifications based upon education, training, and experience to assess a property of the nature, history, and setting of the subject property. We have developed and performed the all appropriate inquiries in conformance with the standards and practices set forth in 40 CFR Part 312.
PROFESSIONAL PROFILE

General Experience Summary

Mr. Zimmermann has over twenty years of experience in the fields of hazardous waste management, environmental due diligence, hydrogeology, contaminant environmental fate and transport, conceptual remedy design, and remedial construction. He has applied this experience on site remediation assignments, single- and multiple-property real estate due diligence assessments, site restoration projects, expert witness and litigation support work, and cost allocation negotiations. The work has been completed within a variety of regulatory frameworks, including CERCLA, RCRA, TSCA, and multiple state programs.

He has provided consulting services to the industrial regulated community since 1983, specializing in addressing environmental issues affecting land use and real estate management nationwide. He supplied these services at sites with residential, commercial, light industry, and heavy industry land use in over 19 states and 3 countries. This work has included over 25 different industry types using a wide range of raw materials, processes, waste products, waste management systems, internal risk management systems, and disclosure conditions.

By virtue of this experience, he has established a working relationship with USEPA and state agencies relevant to managing risk and perceived risk. He is current in the latest approaches to site characterization and remediation being approved by these agencies, including the use of natural attenuation and technical impracticability, alternate remedial concentrations endpoints, containment of creosote free product, and other risk- or technology-based remediation strategies.

New York State and Metropolitan Area Experience Summary

Mr. Zimmermann heads the New York City practice of ELM and has worked on environmental risk management projects in the New York State and Metropolitan Area since 1985. The majority of his work has involved acting as technical lead and project manager for projects involving site characterization, fate and transport analysis, remedial alternatives analysis and remedial construction.

His current focus is in the New York City area, with projects in Manhattan and Queens, as well as in nearby Westchester County and western Long Island. His previous work has been performed in locations across the state, from Rochester to the eastern tip of Long Island. The majority of these projects have required intensive and focused negotiations with NYSDEC and NYSDOH with respect to conceptual site models, and the resulting site
characterization, remedy selection, and remedy implementation. A summary of Mr. Zimmermann’s experience on several projects is provided in the following paragraphs.

**Manhattan Development Project**
Since the fall of 2000, Mr. Zimmermann has been the day-to-day environmental risk management consultant representing the developer for the five Manhattan properties comprising this project, having a total area of approximately nine acres. Buildings ranging from office buildings, electric switching stations, steam and electric generating stations, and fuel storage facilities occupy all but one parcel, which was occupied by a fleet fueling station. Mr. Zimmermann is responsible for integrating the developer’s interest the remediation contractor, site owner and NYSDEC/NYSDOH. The project is considered to be among the largest redevelopment efforts in the United States.

In his role, he has been responsible for supporting the negotiation of all relevant contracting and transactional documents, regulatory management agreements, site investigation and remedial plans, and their implementation. The project is somewhat unique in that all environmentally related work is done under strict schedules that are tied to future construction milestone targets. Thus, the need to correctly forecast and implement regulatory management, appropriate characterization and remediation is paramount. Towards this end, he is also responsible for evaluating the environmental aspects of the constructability of remedial designs and their affect on the long-term development schedule. Finally, he has responsibility for communication of environmental matters in the developer’s interest to prospective tenants, key community relations organizations and other interested land use planning organizations.

The majority of the target substances of concern are petroleum compounds related to former manufactured gas operations, power management, historic landfill operations, and fuel use. Investigation and remediation have focused on source characterization and dissolved-phase ground water impacts. All investigations and remedies have been tied to risk-based exposure scenarios and negotiated understandings of conceptual site models with NYSDEC and NYSDOH. Remediation of the free product has been completed at one site with plans under development for the remaining properties. Source remediation methods used to date have included removal with bio-augmentation. Options for in situ chemical oxidation are included in site contingency plans. Dissolved-phase remediation has been via natural attenuation.

**Borough of Queens, New York City**
Mr. Zimmermann was principal investigator and technical lead for Phase I and Phase II investigations and feasibility studies at two properties totaling approximately three acres. The principal site was a former chemical manufacturer. Primary constituents of concern in soil and ground water were mixed wastes comprised of creosote, metals, arsenical and chlorinated pesticides, BTEX and chlorinated hydrocarbons. Free phase product in the form of LNAPL and DANPL was present at the site.

The scope of the Phase II effort was negotiated with regional and local legal and managerial NYSDEC representatives during meetings and conference calls. Significant portions of one of the properties were underlain by LNAPL and/or DNAPL, depending on the particular
constituent mix of the waste at various locations. A conceptual site model for the properties was developed that highlighted the data gaps necessary to refine migration pathways, their potential for or actual completion, and target remediation endpoints. A site characterization approach was derived and completed to satisfy the identified data gaps and other information necessary to support insurance underwriting scenarios for a property sale. Mr. Zimmerman also led the regulatory outreach effort to negotiate favorable waste characterization determinations with NYSDEC and reduce projected costs from several major soil management risk factors. Templates for assessing various case closure scenarios were developed for use in the transaction negotiation. Additional scenarios were developed that included environmental risk underwriting options to eliminate escrow components and increase transaction value.

**Inactive Oil Terminal, Staten Island**

Mr. Zimmermann was the lead environmental risk management consultant for a group developing a 400-acre+ property in Staten Island. The purpose of the project was to integrate a site characterization and corrective action program with construction of high performance structures and support buildings. Over 70 above ground storage tanks and associated piping were present on the property with capacities up to 200,000-gallons each. These tanks required removal and remediation prior to development. In addition, significant volumes of LNAPL were detected on the water table at the site, up to twelve feet in thickness at some locations.

Mr. Zimmermann participated as developer representative in order to influence the full scope of the site characterization, human health and ecological risk assessment, demolition and tank/pipeline decommissioning work plans/pricing and related agency negotiations. Given the nature of the LNAPL constituents and predicted minimal impact to ground water, remedial plans were able to target free and residual product removal and recycling/re-use as the primary remedial endpoint of the initial remedial planning. An additional responsibility was to participate in a variety of negotiations and presentations involving multiple branches of local and state government, as well as NYSDEC representatives from the hazardous waste group, wetlands, fish and wildlife and permitting.

**Former Oil Terminal Redevelopment, Western Long Island**

Mr. Zimmermann acted as Project Director for remedial investigations, feasibility studies and remediation of affected soils and ground water for this three-acre inactive terminal adjacent to an estuary on the north shore of eastern Long Island. The goal of the remediation was to prepare the site for development as an assisted living community.

The property was contaminated with fuel oils and gasoline from the terminal operations. The petroleum constituents were present in the form of free product and residual product, as well as less impacted soils and ground water contamination. The remediation consisted of demolition, decommissioning and removal of single story concrete block structures, the fueling pumps, piping and awning infrastructure, a 100,000-gallon above ground fuel oil storage tank, multiple underground tar and oil storage tanks, a previously undetected subsurface oil/water separator and associated piping, contaminated wood piers, concrete slabs and footings.
A No Further Action approval was obtained from NYSDEC for this project under an expedited time frame using the state Voluntary Cleanup Program. Mr. Zimmermann was the technical lead for the remediation and case closure work, including the monitored natural attenuation agreements. The project required management of daily on-site NYSDEC negotiations during remediation with respect to termination criteria for the remedial work.

**Former Gas Station and Active DPW Yard, Westchester County**

Mr. Zimmermann acted as Project Director and technical lead for a remedial investigation and remediation at a former gas fueling station adjacent to an active DPW yard. Initial work focused on location and mitigation of the sources of aged petroleum free product migration from the gas station along a bedrock interface and associated leaking sumps in the building interior.

The project incorporated a negotiated ground water natural attenuation approach for multiple contaminant plumes associated with the discrete sources at the fueling station and DPW yard. The existence of the sources was determined by the ELM investigation and re-evaluation of previous investigations by others. Dissolved-phase ground water remediation was completed using oxygen amendment injections in strategically placed post-remediation soil borings, and passive oxygen amendments in existing monitoring wells.

Plume concentration stability was used with agency negotiation with NYSDEC legal and regional representatives under a Voluntary Cleanup Order to achieve No Further Action status for the project. An element of the negotiation strategy was Mr. Zimmermann’s experience with known cases where NYSDEC had approved far greater ground water endpoint concentrations in more sensitive receptor settings.

**EDUCATION**

- B.A. Geological Sciences, University of Maine, 1977
- Graduate Studies in Environmental Geology, U. Vermont, 1978
- Contaminant Transport Modeling, Princeton University, 1986
- M.S. Geology Coursework, Rutgers University, 1985 –1989
- Real Estate Institute, New York University 1999 - 2000

**PROFESSIONAL AFFILIATIONS**

- New Jersey Institute of Technology - Advisory Board for Integrated Manufacturing Education Program
PUBLICATIONS AND PRESENTATIONS

"Soil Contamination and Groundwater Remediation Scenarios" for the New Jersey Water Pollution Control Federation Pre-Conference, March 1990.

“Risk-Based Remediation Strategies for DNAPL Sites” - HazMat International Annual Conference, June 1996.

PROFESSIONAL EXPERIENCE

ENVIRONMENTAL LIABILITY MANAGEMENT OF NEW YORK, LLC
New York, NY, September 2004 to Present

PROJECT MANAGER

Technical responsibilities include designing and managing environmental investigations, evaluating potential contaminant source areas, identifying and assessing potential risks to receptors and developing risk management options. Additional responsibilities include preparation of technical documents including remedial reports and detailed remediation cost estimates.

Management duties include scoping work activities, retaining contractors, coordinating and managing field activities, schedule and budget management, ensuring work site health and safety, preparing sampling and remedial reports, and negotiating with regulatory agencies.

AKRF, INC.
New York, NY, April 1999 to August 2004

PROJECT MANAGER

Specialized in environmental site assessments and investigations, hazardous materials planning studies, and site remediations. Performed Phase I and II environmental site assessments, directs and oversees site remediation projects, and was responsible for hazardous materials aspects of environmental impact statements.

Managed the hazardous materials portions of multi-block rezoning projects in both Long Island City and Brooklyn and managed projects in New York State’s Voluntary Cleanup Program and Brownfields Cleanup Program. Field work experience includes supervising the advancement of soil borings and the installation of temporary and permanent groundwater monitoring wells; sampling soil, groundwater, and soil gas; performing asbestos surveys; and overseeing and directing environmental remediation projects. Project management responsibilities included coordinating subcontractors and other professionals in the activities described above; proposal proposals; sampling protocols, work plan, and health and safety plan preparation; project scheduling; budgeting; and acting as a liaison between clients and regulatory agencies. In addition, conducted over 90 Phase I Environmental Site Assessments and over 30 Transaction Screen Assessments for public and private clients.
Project values ranged from $3,000 to $750,000.

EDUCATION

B.A., Colby College, Waterville, ME
Biology and Spanish Literature, January 1999
